Change History

Version	Date	Updated By	Change
1.0	2017-03-22	Ben Tucker	Initial document release to validators.
1.1	2017-05-30	Ben Tucker	Updates per CMVP comments.
1.2	2017-06-07	Ben Tucker	Added OE19, non-accelerated OE.
1.3	2017-07-21	Ben Tucker	Added KTS, Software-Hybrid and hardware acceleration information.
1.4	2017-07-27	Ben Tucker	Added Processor Pictures as table 4.
1.5	2017-07-28	Ben Tucker	Removed OE19.
1.6	2017-08-04	Ben Tucker	Updated Physical Security to level 1 from N/A.
1.7	2018-07-26	Ben Tucker	Added Operational Environments 20 through 36
1.8	2019-01-08	Ben Tucker	Added SP 800-133 operation descriptions, textual clarifications.
1.9	2019-07-24	Ben Tucker	Added new software version (1.0.2) to Section 1; added 4096 key size to RSA Cert. # 2379 in Table 5
1.10	2020-7-23	Ben Tucker	Added A.13 key usage limits for Triple-DES in Table 5 notes, and added Rule #4 to Section 8.2.
1.11	2021-01-04	Ben Tucker	Added a vendor affirmed operational environments paragraph to Section 1.
1.12	2023-06-16	Corsec Security, Inc.	Moved Triple-DES encryption (including Triple-DES CMAC) functions and DH/ECDH/RSA key agreement functions to non-Approved mode of operation.
1.13	2023-10-04	Corsec Security, Inc.	Updated Table 1

List of Tables

List of Figures

1 Introduction

This document defines the Security Policy for the Citrix FIPS Cryptographic Module, versions 1.0, 1.0.1, and 1.0.2 (hereafter referred to as "the module"). It is a software toolkit which provides various cryptographic functions to support the Citrix product portfolio. This document describes how the module meets FIPS 140-2 Level 1 requirements, and how to operate it in the Approved mode of operation.

The tested configurations make use of Processor Algorithm Accelerators (PAAs): NEON extensions, AES/SHA acceleration, AES-NI, or some combination thereof. Details are specified in the table below.

Table 1 – Cryptographic Module Configurations

	Operating Environment	Tested Platform
1	iOS 10 64bit on ARM v8-A with NEON extensions and AES/SHA Acceleration	Apple 12.9-inch iPad Pro (A1584)
2	Android 4.4 on ARM v7-A with NEON extensions	Google Nexus 5 (LG D820)
3	Android 5 on ARM v7-A with NEON extensions	Google Nexus 6 (Motorola Nexus 6 XT11003)
4	Android 6 on ARM v7-A with NEON extensions	Google Nexus 6 (Motorola Nexus 6 XT11003)
5	Windows 10 32bit on Intel Core i7 [4th Generation] with AES-NI	Lenovo 20CD00B2US
6	Android 6 on ARM v8-A with NEON extensions and AES/SHA Acceleration	Samsung Galaxy S6 (SM-G920T)
7	Android 7 on ARM v7-A with NEON extensions	Google Nexus 6 (Motorola Nexus 6 XT11003)
8	Android 7 on ARM v8-A with NEON extensions and AES/SHA Acceleration	Google Nexus 5X (LG H790)
9	Windows 10 64bit on Intel Core i7 [6th Generation] with AES-NI	Lenovo 20EV002JUS
10	Linux 3.16 under XenServer 6 64bit on Intel Xeon 56xx series with AES-NI	Dell PowerEdge C6100
11	Linux 3.16 under ESXi 5 64bit on Intel Xeon 56xx series with AES-NI	HP ProLiant DL2000
12	Linux 3.16 under Hyper-V on Windows Server 2012 R2 64bit on Intel Xeon 56xx series with AES-NI	HP ProLiant DL2000
13	FreeBSD 8.4 32bit on Intel Xeon E5-26xx v2 series with AES-NI	Citrix NetScaler MPX-14000-FIPS
14	FreeBSD 8.4 64bit on Intel Xeon E5-26xx v2 series with AES-NI	Citrix NetScaler MPX-14000-FIPS

	Operating Environment	Tested Platform
15	Mac OS X 10.12 64bit on Intel Core i7 [4th Generation] with AES-NI	Apple Macbook Pro (A1398)
16	Linux 3.13 64bit on Intel Core i7 [6th Generation] with AES-NI	Lenovo 20EV002JUS
17	ViewSonic Thin OS on ARM v8-A with NEON extensions	ViewSonic VS16585
18	Android 8 64bit on ARM v8-A with NEON extensions and AES/SHA Acceleration	Google Pixel 2
19	iOS 11 on ARM v8-A with NEON extensions and AES/SHA Acceleration	iPhone X
20	Windows 10 64bit on Intel Core i7 [8th Generation] with AES-NI	CyberPowerPC GLC2460
21	Windows 8.1 64bit on Intel Core i7 [8th Generation] with AES-NI	CyberPowerPC GLC2460
22	Linux 3.10 64bit on Intel Core i7 [8th Generation] with AES-NI	CyberPowerPC GLC2460
23	Linux 4.15 64bit on Intel Core i7 [8th Generation] with AES-NI	CyberPowerPC GLC2460
24	Linux 4.x under XenServer 7 64bit on Intel Xeon E526XX v4 series with AES-NI	HPE ProLiant BL460c Gen9
25	Linux 4.x under ESXi 5 64bit on Intel Xeon E5-26XX v4 series with AES-NI	HPE ProLiant BL460c Gen9
26	Linux 4.x under Hyper-V on Windows Server 2012 R2 64bit on Intel Xeon E5-26XX v4 series with AES-NI	HPE ProLiant BL460c Gen9
27	Mac OS X 10.13 64bit on Intel Core i7 [4th Generation] with AES-NI	Apple Mac Mini
28	Linux 4.15 64bit on Intel Xeon E5-26XX v3 series with AES-NI	HPE ProLiant BL460c Gen9
29	Linux 4.15 64bit on Intel Xeon E5-26XX v4 series with AES-NI	HPE ProLiant BL460c Gen9
30	Windows Server 2016 under HyperV on Windows Server 2016 64bit on Intel Xeon E5-26XX v3 series with AES-NI	HPE ProLiant BL460c Gen9
31	Windows Server 2016 under HyperV on Windows Server 2016 64bit on Intel Xeon E5-26XX v4 series with AES-NI	HPE ProLiant BL460c Gen9

Copyright Citrix Systems, Inc., 2016, 2017, 2018, 2019, 2020, 2023 Version 1.13   Page 7 of 31

	Operating Environment	Tested Platform
32	Linux 4.x under XenServer 7 64bit on Intel Xeon E5-24XX v2 series with AES-NI	Dell PowerEdge R320
33	Android 9 on ARM v8-A with NEON extensions and AES/SHA Acceleration	Google Pixel 2
34	NoTouch Desktop on ARM v8-A with NEON extensions and AES/SHA Acceleration	N-computing RX-HDX for Citrix

As allowed by the Implementation Guidance for FIPS 140-2 [IG] G.5, "Maintaining Validation Compliance of Software or Firmware Cryptographic Modules", the validation status of the Citrix FIPS Cryptographic Module is maintained when operated in the following additional configuration:

- Linux 4.x on XenServer 8 64bit running on a Dell PowerEdge R440 with Intel Xeon Silver 4210R

The CMVP makes no statement as to the correct operation of the Module or the security strengths of the generated keys when the specific operational environment is not listed on the validation certificate.

The module is a software library providing a C-language API for use by other processes that require cryptographic functionality. The module is a software-hybrid module, intended for multi-chip standalone physical embodiments. The physical boundary is the general-purpose computer on which the module is installed; the logical boundary is the module API. The module performs no communications other than with the calling application, with the sole exception of RNG seeding via an application callback API function (e.g., from /dev/random or otherwise as determined by the application through the callback API function).

The FIPS 140-2 security levels for the module are as follows:

Table 2 – Security Level of Security Requirements

Security Requirement	Security Level
Cryptographic Module Specification	1
Cryptographic Module Ports and Interfaces	1
Roles, Services, and Authentication	1
Finite State Model	1
Physical Security	1
Operational Environment	1
Cryptographic Key Management	1
EMI/EMC	1
Self-Tests	1
Design Assurance	1
Mitigation of Other Attacks	N/A
Overall Level	**1**

Copyright Citrix Systems, Inc., 2016, 2017, 2018, 2019, 2020, 2023 Version 1.13   Page 8 of 31

Citrix Systems, Inc. Public Material – May be reproduced only in its original entirety (without revision).

1.1 Physical Cryptographic Boundary

The physical form of the module is the general-purpose computer on which the module runs. The module relies on its API for all input and output.

1.2 Logical Cryptographic Boundary and Input/Output

Table 3 describes the module's logical I/O.

Table 3 – Ports and Interfaces

Signal Description	Logical Interface Type
API entry point and corresponding stack parameters	Control in
API entry point data input stack parameters	Data in
API entry point return values and status stack parameters	Status out
API entry point data output stack parameters	Data out

As a software-hybrid module, control of the physical ports is outside module scope. However, when the module is performing self-tests, or is in an error state, all output on the logical data output interface is inhibited. The module is single-threaded and in error scenarios returns only an error value (no data output is returned).

Figure 1 depicts the module's operational environment.

1.3 Modes of Operation

The module supports both an Approved and a non-Approved mode of operation. The Approved mode is invoked by setting the appropriate flag (`FIPS_mode_set(1)`) and by following all procedural restrictions in this document, e.g., the algorithm restrictions in Section 2 and the operator-enforced security rules in Section 8.2.

The Approved mode flag can be checked with the command `FIPS_mode_get()`.

2 Cryptographic Functionality

The module implements the FIPS Approved and not-Approved-but-allowed cryptographic functions listed in the tables below. The implemented key establishment methodologies (KAS and various KDFs) operate on payload data and do not establish keys into the module itself.

Table 5 – Approved and CAVP Validated Cryptographic Functions

Algorithm	Description	Cert #
AES	[FIPS 197, SP 800-38A] Functions: Encryption, Decryption Modes: ECB, CBC, OFB, CFB1, CFB8, CFB128, CTR Key sizes: 128, 192, 256 bits	4397

Algorithm	Description	Cert #
AES-CMAC	[FIPS 197, SP 800-38B] Functions: MAC Generation, MAC Verification Key sizes: 128, 192, 256 bits	4397
AES-CCM	[FIPS 197, SP 800-38C] Functions: Authenticated Encryption, Authenticated Decryption Key sizes: 128, 192, 256 bits	4397
AES-GCM*	[FIPS 197, SP 800-38D] Functions: Authenticated Encryption, Authenticated Decryption Key sizes: 128, 192, 256 bits	4397
AES-XTS**	[FIPS 197, SP 800-38E] Functions: Encryption, Decryption Key sizes: 128, 256 bits	4397
AES-KW	[FIPS 197, SP 800-38F] Functions: Key Wrap, Key Unwrap: Forward and Inverse Modes: KW, KWP Key sizes: 128, 192, 256 bits Key establishment methodology provides between 128 and 256 bits of encryption strength.	4397
CVL: Application Specific KDF†	[SP 800-135-rev1] Functions: TLS v1.0/1.1 KDF, TLS 1.2 KDF, ANSI X9.63-2001 KDF, SSH v2 KDF	1101, 1102 and 1103
CVL: RSASP	[FIPS 186-4, PKCS #1 v2.1] Function: Component Test (Signature Primitive) Key size: 2048	1105
DRBG	[SP 800-90A] Functions: Hash DRBG, HMAC DRBG, CTR DRBG (Use df, No df) Security Strengths: 128, 192, and 256 DRBG instances are automatically seeded from the operating environment (e.g., by reading from /dev/random).	1417

Algorithm	Description	Cert #
DSA	[FIPS 186-4] Functions: PQG Generation, PQG Verification, Key Pair Generation, Signature Generation, Signature Verification Key sizes: 1024*, 2048, 3072 bits Hashes: SHA-1**, SHA-224, SHA-256, SHA-384, SHA-512 *DSA-1024 is restricted to signature verification and public key validation. **Signatures generated using SHA-1 are restricted to protocol use only.	1174
ECDSA	[FIPS 186-4] Functions: Key Pair Generation (ExtraRandomBits and TestingCandidates), Signature Generation, Signature Verification, Public Key Validation Curves and sizes: P-192*, P-224, P-256, P-384, P-521, K-163*, K-233, K-283, K-409, K-571, B-163*, B-233, B-283, B-409, B-571 Hashes: SHA-224, SHA-256, SHA-384, SHA-512 *These legacy curves are restricted to signature verification and public key validation.	1056
HMAC	[FIPS 198-1] Functions: MAC Generation, MAC Verification Hashes: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512	2923
KTS	[SP800-38F] Functions: Key Wrap, Key Unwrap Options: AES-KW, AES-KWP Key sizes: 128, 192, 256 bits Key establishment methodology provides between 128 and 256 bits of encryption strength.	AES #4397

Copyright Citrix Systems, Inc., 2016, 2017, 2018, 2019, 2020, 2023 Version 1.13   Page 21 of 31

Algorithm	Description	Cert #
RSA	[FIPS 186-4, ANSI X9.31-1998, and PKCS #1 v2.1 (PSS and PKCS1.5)] Functions: Key Pair Generation, Signature Generation, Signature Verification Key sizes: 1024*, 2048, 3072, 4096*** bits Hashes: SHA-1*, SHA-224**, SHA-256, SHA-384, SHA-512 Signature schemes: X9.31, PKCS1.5, PSS *These legacy options are only supported for signature verification. **SHA-224 is only supported for PKCS1.5 and PSS. ***RSA 4096 SigGen was tested to FIPS 186-4; and according to CAVP requirements is listed on the CAVP certificate under FIPS 186-2.	2379
SHA	[FIPS 180-4] Functions: Digital Signature Generation, Digital Signature Verification, HMAC, standalone hashing Variants: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512 (See other algorithm listings for specific uses of each variant.)	3626
Triple-DES	[SP 800-67, SP 800-20, IG A.13] Functions: Decryption Modes: TECB, TCBC, TCFB-1, TCFB-8, TCFB-64, TOFB Key sizes: 3-key: 192	2371

*When using GCM, care must be taken to never re-use IVs. In the event of unexpected interruption of a GCM session (e.g., power loss, system crash), keys and IVs must be redistributed.

**XTS must only be used for storage applications, e.g., full disk encryption. The XTS algorithm implementation includes a check to ensure Key_1 ≠ Key_2.

†Application Specific KDFs require an operator-entered shared secret and must only be used in the context of their respective applications, as per SP 800135-rev1 (e.g., the SSH KDF must only be used in the context of SSH).

Copyright Citrix Systems, Inc., 2016, 2017, 2018, 2019, 2020, 2023 Version 1.13   Page 22 of 31

Citrix Systems, Inc. Public Material – May be reproduced only in its original entirety (without revision).

Table 6 – Approved Cryptographic Functions Tested with Vendor Affirmation

Algorithm	Description	Ref.
KDF, Password-Based*	[SP 800-132] Options: PBKDF with Option 1a, 1b, 2a, or 2b Functions: HMAC-based KDF using SHA-1, SHA-224, SHA-256, SHA-384, SHA-512 Restrictions: Salt length ≥16 bytes, iteration count ≥1000 The strength of PBKDF-derived keys is limited by the strength of the input password. This implementation does not enforce a minimum password length. (i.e., one-character passwords are possible, but the resulting keys are trivially guessed.) It is the operator's responsibility to choose a password strength appropriate for their needs.	IG §D.6

CKG: Cryptographic Key Generation	[SP 800-133]
	Section 6.1 Asymmetric signature key generation using unmodified DRBG output
	    • Performed in the crypto-module.
	
	Section 6.2 Asymmetric key establishment key generation using unmodified DRBG output
	    • Performed in the crypto-module.
	
	Section 7.1 Direct symmetric key generation using unmodified DRBG output
	    • Performed in the crypto-module.
	    Note: The cryptomodule does not have a symmetric key generation function per se. Instead, the DRBG can be used by the operator to generate random data that can be imported into the module as symmetric key material.
	
	Section 7.3 Derivation of symmetric keys from a key agreement shared secret.
	    • Performed in the crypto-module.
	
	Section 7.5 Derivation of symmetric keys from a password
	    • Performed in the crypto-module.
	
	Section 7.6 Combining multiple keys and other data
	    • Not supported.
		IG §D.12

*Keys established with a Password-Based KDF (PBKDF) must only be used for storage applications.

†Application Specific KDFs require an operator-entered shared secret and must only be used in the context of their respective applications, as per SP 800135-rev1 (e.g., the SSH KDF must only be used in the context of SSH).

Copyright Citrix Systems, Inc., 2016, 2017, 2018, 2019, 2020, 2023 Version 1.13   Page 23 of 31

Citrix Systems, Inc. Public Material – May be reproduced only in its original entirety (without revision).

Table 7 – Non-Approved but Allowed Cryptographic Functions

Algorithm	Description
MD5 within TLS	MD5 is a component of the TLSv1.0/v1.1 KDF. (SP800-135 rev1 §4.2.1)

Non-Approved Cryptographic Functions for use in non-FIPS mode only:

- RSA, DSA, ECDSA: non-legacy operations with disallowed key/hash sizes (e.g., RSA-1024 sig gen)
- ECC CDH: disallowed curve/key sizes (B/K/P 163, 192)
- MD5: general use
- SHA-1: non-protocol signature generation
- Triple-DES, Triple-DES CMAC: encryption, MAC generation, MAC verification
- KAS: key agreement using RSA, DH, and ECDH (including ECC CDH)
- RSA: decryption

2.1 Critical Security Parameters

All CSPs used by the module are described in this section. All usage of these CSPs by the module (including all CSP lifecycle states) is described in the services detailed in Section 4.

Table 8 – Critical Security Parameters (CSPs)

CSP	Size (bits)	Description / Usage
RSA SGK	2048/3072	RSA signature generation key
RSA KDK	2048/3072	RSA key decryption key
DSA SGK	2048/3072	DSA signature generation key
ECDSA SGK	224-571	ECDSA signature generation key
AES EDK	128/192/256	AES key for encrypt/decrypt as per SP800-38A
AES CMAC	128/192/256	AES CMAC key
AES CCM	128/192/256	AES CCM key
AES GCM	128/192/256	AES GCM key
AES KW	128/192/256	AES KW key (KW, KWP)
AES XTS	K1=128/256 K2=128/256	AES XTS keys
TDES DK	192*	3-key Triple-DES decrypt key
HMAC Key	160-512	HMAC key
Hash_DRBG State	V=440/880 C=440/880	V and C internal state values for Hash_DRBG

CSP	Size (bits)	Description / Usage
HMAC_DRBG State	V=160-512 Key=160-512	V and C internal state values for HMAC_DRBG
CTR_DRBG State	V=128 Key=128-256	V and Key internal state values for CTR_DRBG
Entropy Input	≥256	Entropy input pulled from the operating environment; used to seed a DRBG
KDF Input	≥128	Input materials to a Key Derivation Function
KDF Output	≥128	Key (or key block) output from a Key Derivation Function

* Triple-DES key size of 192 includes 24 parity bits.

2.2 Public Keys

Table 9 – Public Keys

Key	Size (bits)	Description / Usage
RSA SVK	1024/2048/3072	RSA signature verification key
RSA KEK	1024/2048/3072	RSA key encryption key
DSA SVK	1024/2048/3072	DSA signature verification key
ECDSA SVK	192-571	ECDSA signature verification key

Copyright Citrix Systems, Inc., 2016, 2017, 2018, 2019, 2020, 2023 Version 1.13   Page 25 of 31

Citrix Systems, Inc. Public Material – May be reproduced only in its original entirety (without revision).

3 Roles, Authentication and Services

3.1 Assumption of Roles

The module supports two operator roles, User and Cryptographic Officer (CO). The roles have identical functionality, and are not authenticated. Multiple concurrent operators are not supported.

The table below lists the operator roles supported by the module. A new instance of the module is provided to each operator (i.e., calling application).

Table 10 – Roles Description

Role ID	Role Description	Authentication Type
CO	Operational usage of the module.	None
User	Operational usage of the module.	None

3.2 Services

All services implemented by the module are listed in the table below. Each service description also describes all usage of CSPs by the service.

Note that the non-Approved mode provides the same list of services, but with a wider selection of possible algorithms (i.e., the non-Approved algorithms listed below Table 6 may be used).

Table 11 –Services

Service	Roles	Description
Initialize	User, CO	Module initialization. Does not access CSPs.
Self-test	User, CO	Perform self-tests (FIPS_selftest). Does not access CSPs.
Show status	User, CO	Functions that provide module status information: Version (as unsigned long, const char *, or the version number) FIPS Mode (Boolean) Does not access CSPs.
Zeroize	User, CO	Sub-services that destroy CSPs: DRBG Uninstantiate: zeroizes CSPs for a given DRBG Key Cleanse: zeroizes a given key All other services automatically overwrite CSPs stored in allocated memory. Stack cleanup is the responsibility of the calling application.

Service	Roles	Description
Random number generation	User, CO	Used for random number and symmetric key generation. Seed or reseed a DRBG instance Determine security strength of a DRBG instance Obtain random data Uses and updates Hash_DRBG CSPs, HMAC_DRBG CSPs, CTR_DRBG CSPs, Entropy Input.
Asymmetric key generation	User, CO	Used to generate DSA, ECDSA, and RSA keys: RSA SGK, RSA SVK; DSA SGK, DSA SVK; ECDSA SGK, ECDSA SVK There is one supported entropy strength for each mechanism and algorithm type, the maximum specified in SP800-90
Key Derivation	User, CO	Derivation of new keys using the implemented KDFs. Executes using KDF Input, KDF Output
Symmetric block cipher, SP800-38A	User, CO	Used to encrypt or decrypt data. Executes using AES EDK, TDES DK (passed in by the calling process).
Symmetric block cipher, non-38A	User, CO	Used to process data with AES-CCM, AES-GCM, AES-CMAC, or AES-XTS. Executes using the CSP corresponding to the given algorithm and block cipher mode (passed in by the calling process).
Key wrap/unwrap	User, CO	Symmetric key wrapping and unwrapping using AES Key Wrap. Uses the AES KW key.
Message digest	User, CO	Used to generate a SHA-1 or SHA-2 message digest. Does not access CSPs.
Keyed Hash	User, CO	Used to generate or verify data integrity with HMAC. Executes using HMAC Key (passed in by the calling process).
Key Encrypt/Decrypt	User, CO	Used to encrypt or decrypt a key value on behalf of the calling process Executes using RSA KDK, RSA KEK (passed in by the calling process).
Digital signature	User, CO	Used to generate or verify RSA, DSA or ECDSA digital signatures. Executes using RSA SGK, RSA SVK; DSA SGK, DSA SVK; ECDSA SGK, ECDSA SVK (passed in by the calling process).
Utility	User, CO	Miscellaneous helper functions. Does not access CSPs.

4   Self-tests

Each time the module is powered up it tests that the cryptographic algorithms still operate correctly, and that sensitive data have not been damaged. Power-up self–tests are available on demand by power cycling the module.

Copyright Citrix Systems, Inc., 2016, 2017, 2018, 2019, 2020, 2023 Version 1.13   Page 27 of 31

Citrix Systems, Inc. Public Material – May be reproduced only in its original entirety (without revision).

On power-up or reset, the module performs the self-tests described in Table 12 below. All self-tests must be completed successfully prior to any other use of cryptography by the module. If one of the KATs fails, the module enters the error state.

Table 12 – Power Up Self-tests

Test Target	Type	Description
Software integrity	KAT	HMAC-SHA-1
HMAC	KAT	One KAT per SHA-1, SHA-224, SHA-256, SHA-384 and SHA-512 Per IG 9.3, this testing covers SHA POST requirements.
AES	KAT	Separate encrypt and decrypt, ECB mode, 128 bit key length
AES CCM	KAT	Separate encrypt and decrypt, 192 key length
AES GCM	KAT	Separate encrypt and decrypt, 256 key length
AES XTS	KAT	Separate encrypt and decrypt with AES-XTS-128 (for 256-bit XTS), and AES-XTS256 (for 512-bit XTS)
AES KW	KAT	Separate encrypt and decrypt, 256 key length
AES CMAC	KAT	CMAC generate and verify, CBC mode, 128, 192, 256 key lengths
Triple-DES	KAT	Decrypt, ECB mode, 3-Key of size 192
RSA	KAT	Sign and verify using 2048 bit key, SHA-256, PKCS#1
DSA	PCT	Sign and verify using 2048 bit key, SHA-384
DRBG	KAT	CTR_DRBG: AES, 256 bit with and without derivation function HASH_DRBG: SHA-256 HMAC_DRBG: SHA-256
ECDSA	PCT	Keygen, sign, verify using P-224, K-233; with SHA-512.
SSH KDF	KAT	SSH key derivation, SHA-256
X9.63 KDF	KAT	X9.63 key derivation, ECDH S/MIME
X9.42 KDF	KAT	X9.42 key derivation, SHA-256, DH S/MIME

Table 13 – Conditional Self-tests

Test Target	Description
DRBG	DRBG Health Tests as per [SP800-90A §11.3]
DRBG	Continuous RNG test for stuck fault
Entropy source	Continuous RNG test on the entropy (DRBG seed) input
DSA	Pairwise consistency test on each generation of a key pair
ECDSA	Pairwise consistency test on each generation of a key pair
RSA	Pairwise consistency test on each generation of a key pair

5 Physical Security Policy

Physical security is not applicable to this Level 1 software-hybrid module.

6 Operational Environment

The module runs on a general-purpose computer with hardware acceleration, including virtual environments (e.g., a virtual machine or hypervisor). (See Table 1 for a full list of OEs.) The operational environments provide industry-standard user access controls and separation of memory for different processes; this prevents other software components of the operating environment from accessing or tampering with the module's memory space.

The module uses HMAC-SHA1 as integrity protection against tamper of the module on the filesystem.

7 Mitigation of Other Attacks Policy

The module does not specifically mitigate attacks outside the scope of FIPS 140-2.

8 Security Rules and Guidance

8.1 Module-Enforced Security Rules

The module design corresponds to the following module security rules. This section documents the security rules enforced by the cryptographic module to implement the security requirements of this FIPS 140-2 Level 1 module.

1. The module provides two operator roles: User and Cryptographic Officer.

2. The module does not provide authentication.

3. The operator can command the module to perform the power-up self-tests by re-instantiating the module or calling FIPS_selftest().

4. The module contains a Default Entry Point as per IG 9.10. Power-up self-tests are run on module instantiation and do not require any operator action.

5. Data output is inhibited during self-tests and error states. Data output is logically disconnected from processes performing key generation and zeroization.

6. Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the module.

7. There are no restrictions on which keys or other CSPs are zeroized by the zeroization service.

8. The module does not support a maintenance interface or role.

9. The module does not support manual key entry.

10. The module does not have any external input/output devices used for entry/output of data.

11. The module only enters/outputs CSPs via the API, or through the seeding mechanism (callback from the OE provides entropy, e.g., /dev/random).

12. The module does not output intermediate key values over the physical boundary.

13. The module checks XTS keys pairs for duplicates as per IG A.9.

8.2 Operator-Enforced Security Rules

The following rules must be followed by the operator, as they cannot be enforced by the module itself.

1. The user or operator must not share critical security parameters between Approved mode and non-Approved mode algorithms or functions.

2. The user or operator, when implementing other standards, such as Common Criteria Mobile Device Fundamentals 3.0, may need to perform cryptographic operations with this module to create KEKs via DRBG or other needed protection mechanisms using specific algorithms, such as PBKDF. Please refer to those other standards for specifics.

3. The user or operator of the module must enforce all required locking mechanisms for code reentrancy into the module, if multi-threading is desired.

9   Secure Distribution and Operation

The Citrix FIPS Cryptographic Module is intended for sole use by Citrix Systems, Inc. and its employees. As a result, the module is only made available to Citrix personnel through a Citrix-owned secure internal server. Only authorized employees have access to the module.

The FIPS 140-2 required power-on self-tests execute automatically without user intervention upon initialization of the module. Once self-tests have completed successfully, the module is operating in the Approved mode of operation.

10   References and Definitions

The following standards are referred to in this Security Policy.
