Representing Policy for Enterprise Compliance

NIST Privilege Management Workshop Plenary Session September 1, 2009

K. Krasnow Waterman LawTechIntersect, LLC

kkw@LawTechIntersect.com

Speaker Bio

Present:

- Law & Technology consultant
- Visiting Fellow, Massachusetts Institute of Technology, Decentralized Information Group, Computer Science & Artificial Intelligence Lab
- Co-Chair, Artificial Intelligence Committee, American Bar Association

Past

- CIO, Foreign Terrorist Tracking Task Force
- Section Chief (interim), Intelligence Infrastructure, FBI
- Assistant General Counsel, FBI
- Dual Degrees Law and Management of Technology

Policy

Multiple documents mandate when and how data should be accessed, retained, manipulated, shared, and destroyed

- Law
- Regulation
- Contract
- MOU
- Organizational policy
- Counsel opinion

Legal Policies

Typically address

- Persons/entities
- Data
- Action
- Context/Circumstances

Past

- Handled compliance *outside* enterprise systems.
 - Human determination that a person met criteria for privilege
- Privilege grants failed to meet requirements of policy
 - Rigid (e.g., view only, full rights) instead of flexible based upon the situation
 - Subjective (who you knew) instead of objective
 - Too long (userids grew stale) instead of tracking the work/credentials of the individual
 - Too broad (a whole data repository) rather than to specific data records or elements

Present

- Increased evaluation/use of tools to include more policy compliance *inside* enterprise systems
 - Rules engines
 - Role identification
- Incremental improvement, but still fail to be fully policy compliant
 - Collection of rules from business users tend to be anecdotal, incomplete, and/or incorrect
 - User authoring tools tend to lack necessary complexity or nuance
 - Role identification is one of several pieces needed to fufill requirements of policy

Goal

Dynamic policy compliance

– Allowing only those privileges

- which are permitted by the *actual* rules as they apply to
 - the actor at that moment
 - the data in context
 - the specific environment
- Requires turning policy into code

The Problem: Hypothetical

Typical User Rule Statement:
 "Nurses may look at patient files."

Typical Policy Statement:

"Nurses, who are licensed in the state where they are working, have successfully completed HIPAA training in the last year, and are employees of the facility or employees of contractors currently providing services to the facility, may look at the files of patients on the floor or wing to which they are assigned, during the shift in which they are assigned to that floor or wing as well as one hour before and after that shift."

Shorter Rules aren't Real

Multiple causes

- Easier for business user to remember and say
 - Typically the result of passing original statement of policy from management or attorney through multiple hands over time

Easier for programmer to code

Nuances are often dropped from rule because they are believed to be of no value or subsumed by some other value

Easier to find/reach relevant data

 Only requires access to two pieces of data/metadata – user role, data category of file

Real Rules are Hard

Harder because:

- Derived from multiple rules
 - One requires licensure, one is a federal privacy law, one requires hospital affiliation, one sets access policy

Data needed for compliance is in more places

- Not all within the control of the party granting access
- More complex
 - More conditions
 - Temporal requirements

Real Example

"...No agency shall disclose any record which is contained in a system of records by any means of communication to any person, or to another agency, except pursuant to a written request by, or with the prior written consent of, the individual to whom the record pertains, unless disclosure of the record would be—

to another agency or to an instrumentality of any governmental jurisdiction within or under the control of the United States for a civil or criminal law enforcement activity if the activity is authorized by law, and if the head of the agency or instrumentality has made a written request to the agency which maintains the record specifying the particular portion desired and the law enforcement activity for which the record is sought;"

Privacy Act, 5 USC § 552a(b) & (b)(7)

kkw@LawTechIntersect.com

Real Example Challenges

In this one portion of the Privacy Act:

- 4 terms have specific, non-universal definitions
 - Stated elsewhere
- 3 conditions
- 3 exceptions
 - 3rd exception has 4 conditions
- 4 parties are identified
- 2 precursors are identified
- 2 authorized purposes are identified

The Privacy Act has 135 sub-rules

Improving Policy Expression

Intermediate Isomorphic Representation

- Intermediate
 - A form through which lawyers, policy makers, business users, and programmers can ensure they understand each other
- Isomorphic:
 - A one for one representation
 - Avoids interpretations accidentally influencing outcomes
 - Easier to incorporate policy updates
 - Easier to incorporate administrative/procedural details
 - see, e.g., Bench-Capon, TJM & Coenen, FP, *Isomorphism and Legal Knowledge Based Systems*, Artificial Intelligence and Law, Vol 1, No 1, pp65-86 (1992).
- A "Rosetta Stone"

Why "intermediate" representation?

- Don't speak the same language
 - Lawyers
 - Write concept-based, run-on text
 - Read left to right
 - Computer Scientists
 - Write short, logic-based expressions
 - Read top to bottom
- Need a form both groups can readily assimilate

Why "isomorphic" representation?

- Compound information differently
 - Lawyers
 - Add conditions, exceptions, and other compounding features
 - Computer Scientists
 - Compute the statements and represent the leanest form
- Using a consistent structure is needed for lawyers to validate the expressions

Example

Policy Mapping Project (FY09)

 Funded by DHS
 Joint project of LawTechIntersect, LLC & PKH Enterprises, LLC
 Will be presented in Track 4 Workshop

Reading the Policy Map

Read across the spreadsheet, taking the column name and then a column value. (Blanks = "any")

Rule Example:

A <u>Government:Federal:Executive:DHS:I&A</u> individual is <u>permitted</u> to <u>retain</u> information about <u>people</u> including <u>PII:US persons</u> if [the data is] <u>about the providers of data</u> <u>AND system:Enterprise Records System</u>

Policy Map: Admin (right)

Reading the Policy Map

Read across the spreadsheet, taking the column name and then a column value. (Blanks = "any")

Administrative Example:

If there's a conflict, this rule is precedence level <u>1.4:Federal:Regulation</u>. [The rule is] called <u>DHS ERS SORN</u>, found at <u>73 FR 28128</u>, And within that at <u>Categories of Individuals</u>, I, p. 28133, Dated <u>published: 05/15/08</u>, effective 06/16/08 Which for reference we call [record number] <u>230009</u> And is linked to [record numbers] <u>23010</u>, 23045, 23049] Because [link is] <u>AND</u>

Benefits

Accelerates enhancements to policy compliance technology

- Showing policy language authors where enhanced expressivity is needed
- Showing the ontologic and taxonomic categories in which things belong

 Showing reasoner developers the level and type of complexity to be addressed

Benefits

Revealing the variables and values that compliance systems need to reach

- Allowing systems developers to determine the incremental order of implementation based upon
 - which are already available,
 - which must be captured in next system versions, and
 - which are too difficult and should be captured through user assertions
