### Role Based Access Control on the World Wide Web

John Barkley Project Leader RBAC/Web Implementation National Institutes of Standards and Technology (301) 975-3346 jbarkley@nist.gov http://hissa.ncsl.nist.gov/rbac/

# **RBAC** on the WWW

## Problem:

- Administrators view organizations in terms of individuals and their roles.
- Access to the WWW is enforced by group and access control list (ACL) mechanisms.
- Administrators must map their organizational view to these mechanisms.

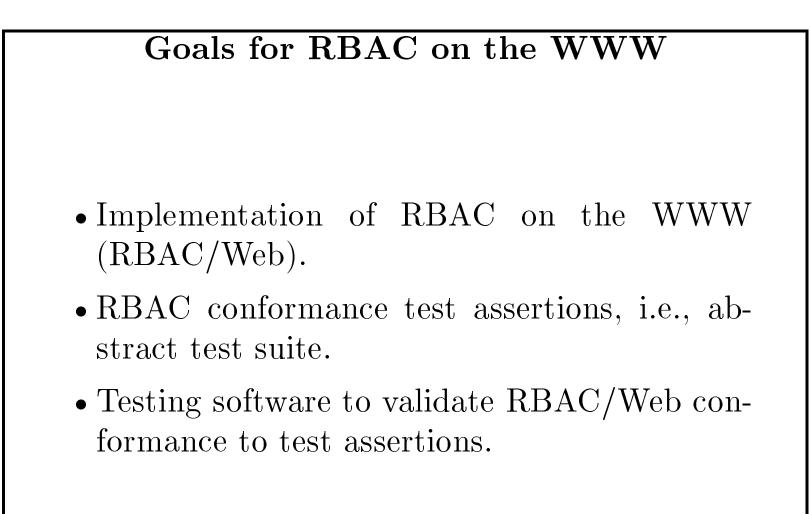

### **RBAC** on the WWW

Solution: role based access control

- Access based on user's organizational role, e.g., doctor, nurse, bank teller.
- Higher level of abstraction compared to commonly used access control mechanisms, e.g., MLS.
- An administrators organizational view **IS** the access control mechanism.
- => RBAC valuable for "intra-net" enterprise use of WWW

### Security Administration with RBAC

- For each role: assign privileged operations, e.g., Doctor: prescribe\_drugs, order\_tests.
- To give privileges to a user: assign role(s) to user, e.g., Milken: broker, bond\_dealer, crook.
- To remove a user's privileges: remove role(s) from user, e.g., Milken: crook.

## **Prior NIST RBAC Activities**

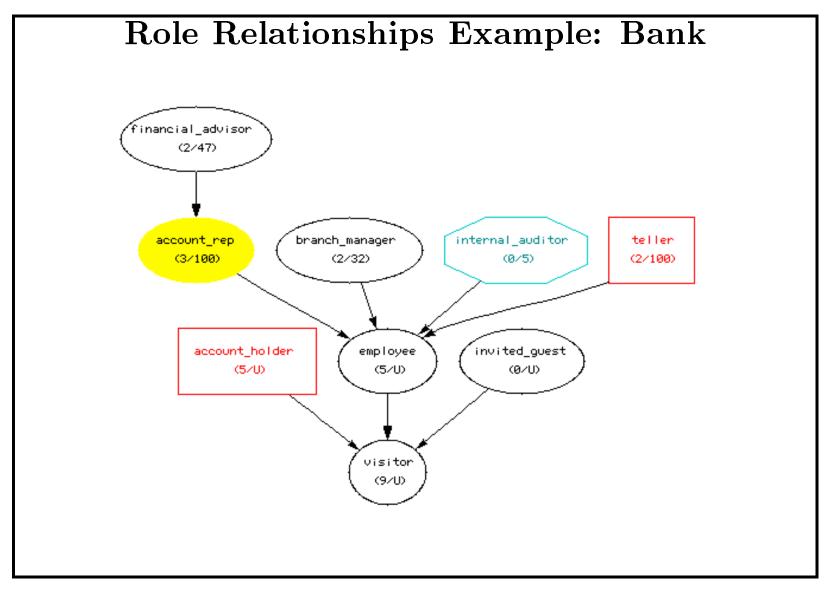

- NIST developed first formal, general model of RBAC
- NIST work cited as "closest prior art" in IBM's patent application for IBM version of RBAC
- Sybase implementing RBAC based on NIST papers
- NIST implemented RBAC on NSA's Synergy secure operating system

## NIST RBAC Model (Ferraiolo,Kuhn,Cugini)

- Users are associated with role(s), e.g., Koop: doctor.
- Roles are associated with privileged operation(s), e.g., doctor: prescribe\_drugs, order\_tests.
- A user has access to a privileged operation only if the user has an authorized role which is associated with that privileged operation.

#### NIST RBAC Model: Role Relationships

- Roles may be related hierarchically, e.g., surgeon $\longrightarrow$ doctor.
- Roles may have conflict of interest relationships:
  - Static Separation of Duties (SSD), e.g., comptroller and auditor cannot be authorized for the same user.
  - Dynamic Separation of Duties (DSD), e.g., teller and account\_holder can be authorized for the same user but cannot both be active.
- The number of users authorized for a given role may be limited by the cardinality of that role, e.g., president has cardinality one.

1.9

# **RBAC/Web** Implementation

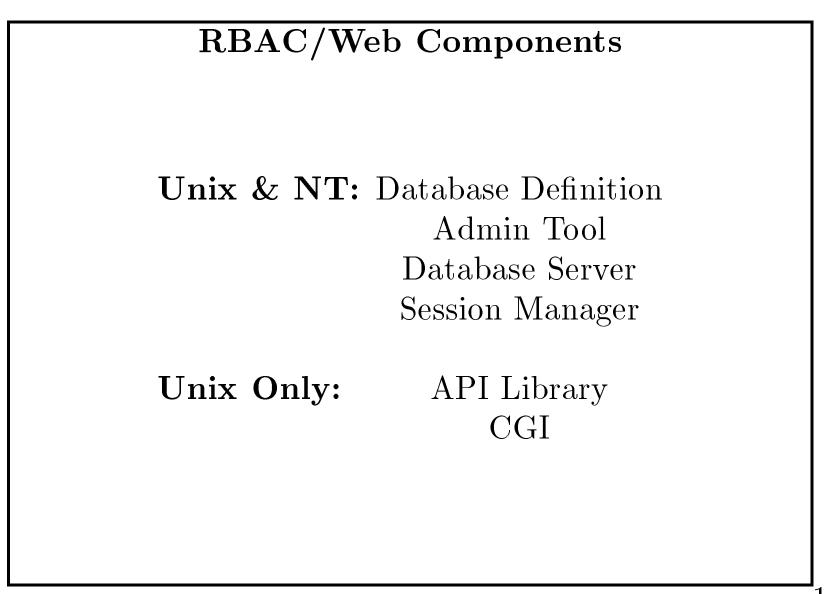

- Uses existing WWW technology.
- Can be used with any browser.
- Can be used with any authentication mechanism, e.g., SSL, SHTTP, PCT.
- Privileged operations are HTTP methods, e.g., GET, POST, PUT.
- Available for Unix (e.g., Netscape, Apache) and Windows NT (e.g., IIS, Website).

### End User Scenario

- Establishes authentication session.
- Establishes active role set (ARS) for RBAC Session:
  - If no DSD, then RBAC Session automatically becomes only possible ARS.
  - If DSD, then end user chooses ARS for RBAC Session.
- Accesses URLs normally subject to ARS.

### Admnistrator Scenario

- Defines roles and their hierarchy, SSD, DSD, and cardinality.
- Defines mapping from URLs to files.
- Assigns to each file the HTTP method(s) and role(s) permitted to perform those method(s).
- Assigns role(s) to each user (authorized roles become assigned roles plus roles inherited from the assigned roles).

# **RBAC/Web Database Definition**

Data sets which specify:

- Association between users and their roles.
- Role hierarchy.
- SSD relationships.
- DSD relationships.
- ARSs.
- Association between WWW server files, HTTP methods, and roles.

# RBAC/Web Admin Tool

- Accessed by means of a WWW browser.
- Creates users and roles.
- Associates users with roles and roles with HTTP methods applied to files.
- Specifies role relationships, i.e., hierarchy, SSD, DSD.

- Hosts the authoritative copies of the data sets defining users, roles, and role relationships.
- Notifies WWW servers to update their cached copies of these data sets when authoritative copies change.
