

Efficient Implementation of Pairing on Sensor Nodes

Tsukasa Ishiguro, Masaaki Shirase, *Tsuyoshi Takagi
Future University Hakodate, Japan

Sensor Node

- MICAz
 - CPU: ATmega128L at 7.37MHz
 - ROM: 128kB
 - SRAM: 4kB
 - 8-bit CPU
 - Size: 62x35x27 (mm)

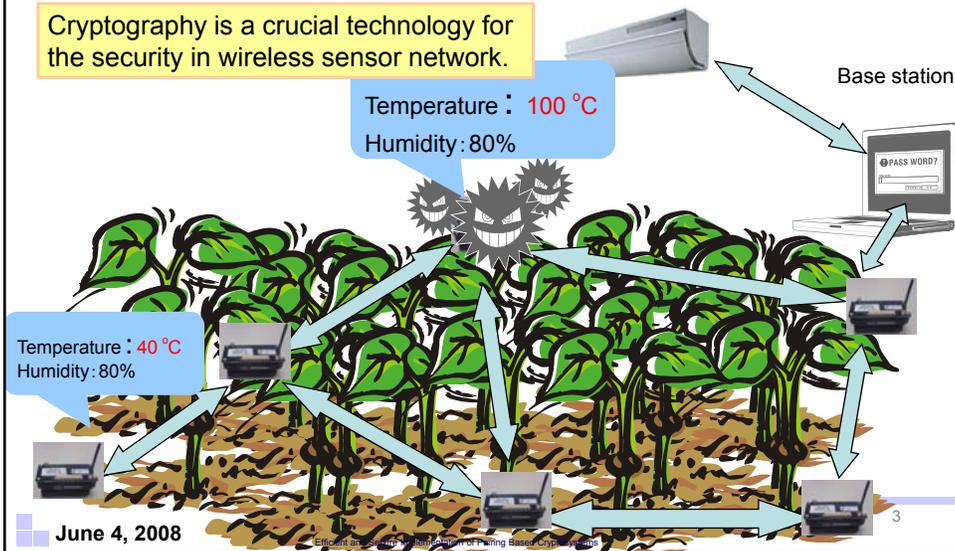

Crossbow (<http://www.xbow.com>)

- TinyOS: operating system
- NesC: C programming language

Security in Wireless Sensor Network

Cryptography is a crucial technology for the security in wireless sensor network.

Pairing Based Cryptography

- Novel Cryptographic Applications
 - ID Based Cryptography [Sakai et al. 2000, Boneh et al. 2001]
 - Efficient Broadcast Encryption [Boneh et al. 2005]
 - Keyword Searchable Encryption [Boneh et al. 2004]
 - etc
- Goal of This Research
 - Implementation of Pairing on ATmega128L

Recent Implementations of PKC on ATmega128L using NesC

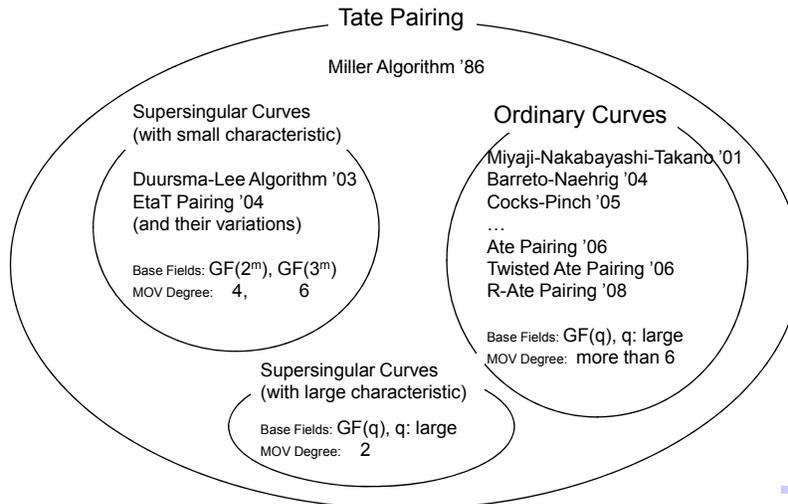

- **TinyPK, 14.5 sec, Watro et al. 2004**
RSA cryptosystem with $e=3$, n : 1024 bits, NesC
- **TinyECC, 1.9 sec, Liu et al. 2005**
ECC, SECG curve over $GF(q)$, q : 160-bit prime, NesC+Assembly
- **TinyECCK, 1.1 sec, Chung et al. 2007**
ECC, Koblitz curve over $GF(2^{163})$, Nesc
- **TinyTate, 30.2 sec, Oliveira et al. 2007**
Tate pairing, Supersingular curves $GF(q)$, q : 256-bit prime, NesC
- **TinyPBC, 5.5 sec, Oliveira et al. 2007**
 η_T pairing, supersingular curves $GF(2^{271})$, NesC
- **Ours, 5.8 sec, Ishiguro et al. 2007**
 η_T pairing, supersingular curves $GF(3^{97})$, NesC

Type of Pairing

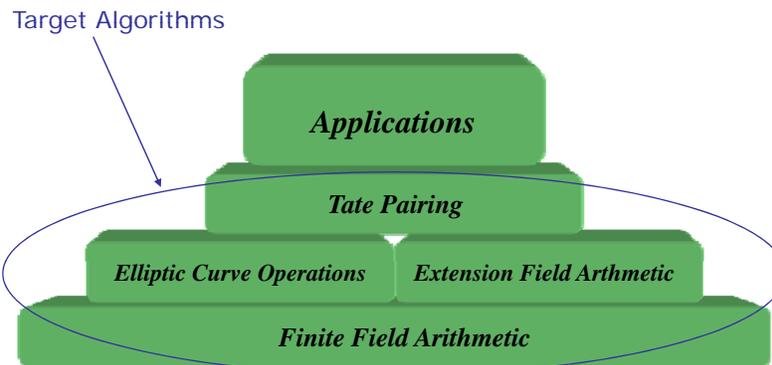

Pairing $e: G_1 \times G_2 \rightarrow G_T$

- **Symmetric Pairing**
There is an efficient homomorphism $\varphi: G_1 \rightarrow G_2$ (or $G_1 = G_2$).
- **Asymmetric Pairing**
There is no efficient homomorphism $\varphi: G_1 \rightarrow G_2$ (and $G_1 \neq G_2$).
- **Composite Order Pairing**
 $G_1 = G_2$ has a subgroup of composite order, e.g. RSA modulus.
- **Hyperelliptic Curve Pairing**
pairing using hyperelliptic curves.

Several Pairings using Elliptic Curves

Implementation of PBC

η_T Pairing (2004)

- Input: $P = (x_p, y_p), Q = (x_q, y_q) \in E(GF(3^m))$
- Output: $\eta_T(P, Q) \in GF(3^{6m})$

```

 $y_p \leftarrow -y_p, f \leftarrow y_q \sigma - y_p + y_p(-x_q + \rho - x_p)$  Initialization
for  $i \leftarrow 0$  to  $(m-1)/2$  do
     $u \leftarrow x_p + x_q + 1$  Addition (+), Subtraction (-),
     $g \leftarrow y_p y_q \sigma - u^2 - u\rho - \rho^2$ 
     $f \leftarrow f \cdot g$ 
     $x_p \leftarrow x_p^{1/3}, y_p \leftarrow y_p^{1/3}, x_q \leftarrow x_q^3, y_q \leftarrow y_q^3$  Main loop
end for
return  $f^{(3^{3m}-1)(3^m+1)(3^m-3^{(m+1)/2}+1)}$  Final exponentiation
    
```

Finite Fields $GF(3^m)$ (or F_{3^m})

- Arithmetic of $GF(3^m)$
 - Addition/Subtraction (A), Multiplication (M), Cubing (C), Inversion (I)
 - We can implement them using AND,OR,XOR.
- Extension Fields $GF(3^{6m})$
 - We can implement it using (A,M,C,I) of $GF(3^m)$
 - Elements $A = (a_5, a_4, a_3, a_2, a_1, a_0)$
 $= a_5 \sigma \rho^2 + a_4 \sigma \rho + a_3 \sigma + a_2 \rho^2 + a_1 \rho + a_0$
 $(a_i \in GF(3^m), \rho^3 = \rho + 1, \sigma^2 = -1)$

Polynomial Base (m=97)

- Polynomial Base $GF(3^m) = GF(3)[x]/(x^{97}+x^{16}+2)$
- $GF(3)$ is represented by (hi,lo)-bit.
 - $a = (a_{hi}, a_{lo})$, a in $GF(3)=\{0,1,2\}$.
 - $0 = (0,0)$, $1 = (0,1)$, $2 = (1,0)$

Addition

$A(x), B(x)$ in $GF(3^{97})$

$C(x) = A(x) + B(x)$

$$= (a_{97}+b_{97}) x^{97} + (a_{96}+b_{96}) x^{96} + \dots + (a_0+b_0)$$

Algorithm

- 1) $t = (a_{hi} \mid a_{lo}) \& (b_{hi} \mid b_{lo})$
- 2) $c_{hi} = t \wedge (a_{hi} \mid b_{hi})$
- 3) $c_{lo} = t \wedge (a_{lo} \mid b_{lo})$

Boolean Gates: AND(&), OR(|), XOR(^)

Multiplication

Input: $a(x) = a_{96}x^{96} + a_{95}x^{95} + \dots + a_0x^0 \in GF(3^{97})$
 $b(x) = b_{96}x^{96} + b_{95}x^{95} + \dots + b_0x^0 \in GF(3^{97})$
 $f(x) = x^{97} + x^{12} + 2$

Output: $c(x) = a(x) \times b(x) \bmod f(x)$

$\left(\begin{array}{l} a_i, b_i \in GF(3) \\ i = 0, 1, \dots, 96 \end{array} \right)$

1: Multiplication of polynomials

$$c'(x) = a(x) \times b(x)$$

$$= a_{96}b_{96}x^{192} + (a_{95}b_{96} + a_{96}b_{95})x^{191} + \dots + a_0b_0x^0$$

2: Reduction

$$c(x) = c'(x) \bmod f(x)$$

Faster Cubing

Reduction trinomial $x^{97}+x^{16}+2$ allows us a simple pre-computation.

Timing

Comparison

	TinyPK	TinyECC	TinyECCK	TinyTate	TinyPBC	Ours
Language	NesC	NesC,asm	NesC	NesC	NesC	NesC
Cryptosystem	RSA	ECC (char. p)	ECC (char. 2)	Tate (char.p)	η_T (char. 2)	η_T (char. 3)
ROM (bytes)	12,408	13,858	5,592	18,384	47,948	17,284
RAM (bytes)	1,167	1,440	1,002	1,831	368 (Stack 2,867)	628
Timing (sec)	14.5	1.9	0.9	30.2	5.5	5.8

Conclusion

- We implemented the η_T pairing of char. 3 on sensor node.
- The implementation is optimized for ATmega128L.
- The timing for $GF(3^{97})$ is about 5.8 seconds.

Future works

- Implementation by inline assembly
- Cryptographic applications using pairing
