1 Module Overview

The Network Security Platform (NSP) Sensor M-8000 P (HW P/N M-8000 P, Version 1.40; FW Version 5.1.15.12) is a multi-chip standalone cryptographic module as defined by FIPS 140-2. It is an Intrusion Prevention System (IPS) and Intrusion Detection System (IDS) designed for network protection. The M-8000 P offers protection against zero-day, DoS/DDoS, encrypted and SYN Flood attacks, and real-time prevention of threats like spyware, malware, VoIP vulnerabilities, phishing, botnets, network worms, Trojans, and peer-to-peer applications. The cryptographic boundary is the outer perimeter of the enclosure, including the removable power supplies and fan trays. (The power supplies and fan trays are excluded from FIPS 140-2 requirements, as they are not security relevant.)

The McAfee M-8000 product consists of the M-8000 P cryptographic module physically connected with the M-8000 S cryptographic module. This security policy describes the M-8000 P only.

Figure 1 shows the module and its cryptographic boundary.

Figure 1 – Image of the Cryptographic Module
2 Security Level

The cryptographic module meets the overall requirements applicable to Level 2 security of FIPS 140-2. Table 1 specifies the levels met for specific FIPS 140-2 areas.

</table>
3 Modes of Operation

The module only supports a FIPS Approved mode of operation. An operator can obtain the FIPS mode indicator by executing the “show” or “status” CLI command which returns the modules firmware version, HW version, etc. The versions will need to match the FIPS validated versions located on the CMVP website.

3.1 FIPS Approved Mode of Operation

The module supports the following FIPS Approved algorithms:

- AES CBC mode with 128 bits for encryption and decryption (Cert. #880)
- Triple-DES CBC mode with 2 and 3 keys for encryption and decryption (Cert. #781)
- RSA with 1024 and 2048 bit keys for signature generation/verification (Cert. #425)
- DSA with 1024 bit keys for key generation, signature generation/verification (Cert. #345)
- SHA-1 and SHA-256 for hashing (Cert. #871)
- ANSI X9.31 RNG with 2-Key Triple-DES ECB (Cert. #505)
- XYSSL RSA with 2048 bit keys for signature verification (Cert. #486)
- XYSSL SHA-1 for hashing (Cert. #970)

The module supports the following FIPS allowed algorithms and protocols:

- RSA with 1024 bit keys for key wrap decryption only (of bulk channel encryption/decryption key) – key wrapping; key establishment methodology provides 80 bits of encryption strength
- NDRNG for seeding the ANSI X9.31 RNG
- TLS v1.0 (with algorithm tested ciphers)
- SSH v2 (with algorithm tested ciphers)
4 Ports and Interfaces
Table 2 provides the cryptographic module’s ports and interfaces.

Table 2 – Ports Quantities per Platform

<table>
<thead>

<td>Power Input</td>
<td>2</td>
</tr>
<tr>
<td>RJ11 Control Port</td>
<td>Data Input, Power Output</td>
<td>8</td>
</tr>
</tbody>
</table>

Note: Two 10-GigE ports (out of eight) are used to connect to the peer M-8000 S unit. The other six are used to monitor external traffic.

The module also contains multiple LEDs for status output.

The module supports the following communication channels with the Network Security Platform (NSP) Manager (aka ISM):

- Install channel: Only used to associate a Sensor with the ISM (i.e., NSP Manager, see Table 3). They use a “shared secret”. ISM listening on port 8501.
- Trusted Alert/Control channel (TLS): ISM listening on port 8502
- Trusted Packet log channel (TLS): ISM listening on port 8503
- Command channel (SNMP, plaintext): SNMP master agent listening on port 8500
- Bulk transfer channel (All is encrypted output): ISM listening on port 8504
5 Identification and Authentication Policy

The cryptographic module shall support three distinct operator roles (Admin, NSP Manager and M-8000 S). The cryptographic module shall enforce the separation of roles using role-based operator authentication. Table 3 lists the supported operator roles along with their required identification and authentication techniques. Table 4 outlines each authentication mechanism and the associated strengths.

Table 3 - Roles and Required Identification and Authentication

<table>
<thead>
<tr>
<th>Role</th>
<th>Type of Authentication</th>
<th>Authentication Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin (User)</td>
<td>Role-based authentication</td>
<td>Username and Password</td>
</tr>
<tr>
<td>NSP Manager (Cryptographic Officer)*</td>
<td>Role-based authentication</td>
<td>Digital Signature (TLS), SNMPv3 Shared Secret</td>
</tr>
<tr>
<td>M-8000 S</td>
<td>Role-based authentication</td>
<td>Username and Password</td>
</tr>
</tbody>
</table>

*Note: The Network Security Platform Manager (NSP Manager) is a machine that manages multiple Network Platform Security Sensors (i.e., the cryptographic module described in this Security Policy). The NSP Manager is also referred to as the ISM (IntruShield Security Manager) which is its former name.

Table 4 – Strengths of Authentication Mechanisms

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Username and Password</td>
<td>The password is an alphanumeric string of a minimum of 15 characters chosen from the set of 90 printable and human-readable characters.</td>
</tr>
<tr>
<td></td>
<td>The probability that a random attempt will succeed or a false acceptance will occur is 1/90^15 which is less than 1/1,000,000.</td>
</tr>
<tr>
<td></td>
<td>After three failed authentication attempts, the module will enforce a 1 minute delay prior to allowing retry. The probability of successfully authenticating to the module within one minute is also 3/90^15 which is less than 1/100,000.</td>
</tr>
<tr>
<td>Digital Signature and RSA key wrap</td>
<td>RSA 1024 and 2048-bit keys are used for the signing (in isolated McAfee laboratory) and verification (by sensor) of digital signatures.</td>
</tr>
<tr>
<td></td>
<td>The probability that a random attempt will succeed or a false acceptance will occur is 1/2^80 which is less than 1/1,000,000.</td>
</tr>
<tr>
<td></td>
<td>The module can only perform a single digital signature verification per second. The probability of successfully authenticating to the module within one minute is 60/2^80 which is less than 1/100,000.</td>
</tr>
</tbody>
</table>
6 Access Control Policy

6.1 Roles and Services

Table 5 lists each operator role and the services authorized for each role. Following Table 5, all unauthenticated services are listed.

<table>
<thead>
<tr>
<th>Role</th>
<th>Authorized Services</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin NSP Manager M-8000 S</td>
<td></td>
</tr>
</tbody>
</table>
X X X **Show Status**: Provides module status, usage statistics, log data, and alerts.  
X **Network Configuration**: Establish network settings for the module or set them back to default values.  
X **Administrative Configuration**: Other various services provided for admin, private, and support levels.  
X **Firmware Update**: Install an external firmware image through TFTP or compact flash.  
X **Install with ISM**: Configures module for use. This step includes establishing trust between the module and the associated management station.  
X **Change Passwords**: Allows the Admin to change their associated passwords and the M-8000 Password.  
X **Certificate Management**: Allows Admin to install and export certificates.  
X **Zeroize**: Destroys all plaintext secrets contained within the module.  
X **Intrusion Detection/Prevention Management**: Management of intrusion detection/prevention policies and configurations through SNMPv3 and TLS.  
X **Disable Admin**: Disables SSH and Console. |

Unauthenticated Services:

The cryptographic module supports the following unauthenticated services:

- **Self-Tests**: This service executes the suite of self-tests required by FIPS 140-2.
- **Intrusion Prevention Services**: Offers protection against zero-day, DoS/DDoS, encrypted and SYN Flood attacks, and real-time prevention of threats like spyware, malware, VoIP vulnerabilities, phishing, botnets, network worms, Trojans, and peer-to-peer applications. *Note*: No crypto is performed during this service.
6.2 **Definition of Critical Security Parameters (CSPs)**

The following are CSPs contained in the module:

- **Administrator Passwords**: Password used for authentication of the “admin” role through console and SSH login. Extended services are given to the “admin” role by using the “support” or “private” passwords.

- **M-8000 Password**: Password used for authentication of M-8000 S.

- **ISM Initialization Secret (i.e., ISM Shared Secret)**: Password used for mutual authentication of the sensor and ISM during initialization.

- **Bulk Transfer Channel Session Key**: AES 128 bit key used to encrypt data packages across the bulk transfer channel.

- **SSH Host Private Keys**: DSA or RSA 1024 bit key used for authentication of sensor to remote terminal for CLI access.

- **TLS Sensor Private Key (for ISM)**: RSA 1024 bit key used for authentication of the sensor to ISM.

- **Seed for RNG**: Seed created by NDRNG and used to seed the ANSI X9.31 RNG.

- **Seed Key for RNG**: Seed created by NDRNG and used as the Triple DES key used in the ANSI X9.31 RNG.

6.3 **Definition of Public Keys**:

The following are the public keys contained in the module:

- **McAfee FW Verification Key**: RSA 2048 bit key used to authenticate firmware images loaded into the module.

- **SSH Host Public Key**: DSA or RSA 1024 bit key used to authenticate the sensor to the remote client during SSH.

- **SSH Remote Client Public Key**: DSA or RSA 1024 bit key used to authenticate the remote client to the sensor during SSH.

- **TLS Sensor Public Key (for ISM)**: RSA 1024 bit key used to authenticate the sensor to ISM during TLS connections.

- **TLS ISM Public Key**: RSA 1024 bit key used to authenticate ISM to sensor during TLS connections.
6.4 **Definition of CSPs Modes of Access**

Table 6 defines the relationship between access to keys/CSPs and the different module services. The types of access used in the table are Read (R), Write (W), and Zeroize (Z).

**Table 6 – Key/CSP Access Rights within Services**

7 Operational Environment

The FIPS 140-2 Area 6 Operational Environment requirements are not applicable because the device supports a limited operational environment.

8 Security Rules

The cryptographic module’s design corresponds to the module’s security rules. This section documents the security rules enforced by the cryptographic module to implement the security requirements of this FIPS 140-2 Level 2 module.

1. The cryptographic module shall provide three distinct operator roles: Admin, NSP Manager and M-8000 S.

2. The cryptographic module shall provide role-based authentication.

3. When the module has not been placed in a valid role, the operator shall not have access to any cryptographic services.

4. The cryptographic module shall perform the following tests:

   A. Power up Self-Tests:

      1. Cryptographic algorithm known answer tests:
         a. AES CBC 128 encryption/decryption Known Answer Tests
         b. Triple-DES CBC encryption/decryption Known Answer Tests
         c. RSA 1024 and 2048 Sign/Verify Known Answer Test
         d. DSA 1024 Sign/Verify Known Answer Test
         e. SHA-1 Known Answer Test
         f. SHA-256 Known Answer Test
         g. ANSI X9.31 RNG Known Answer Test
         h. RSA 1024 Decrypt Known Answer Test
         i. XYSSL RSA 2048 Verify Known Answer Test
         j. XYSSL SHA-1 Known Answer Test

      2. Firmware Integrity Test: XYSSL RSA 2048 used

      3. Critical Functions Tests: N/A

   B. Conditional Self-Tests:

      a. ANSI X9.31 RNG Continuous Test
      b. NDRNG Continuous Test
      c. RSA Sign/Verify Pairwise Consistency Test
      d. DSA Sign/Verify Pairwise Consistency Test
      e. External Firmware Load Test – XYSSL RSA 2048 used
5. At any time the cryptographic module is in an idle state, the operator shall be capable of commanding the module to perform the power up self-test by power cycling.

6. Data output shall be inhibited during key generation, self-tests, zeroization, and error states.

7. Status information shall not contain CSPs or sensitive data that if misused could lead to a compromise of the module.

8. The module shall only support five concurrent SSH operators when SSH is enabled.

9. If a non FIPS validated firmware version is loaded onto the module, then the module is no longer a FIPS validated module.

10. The use of the Console Port shall be restricted to the initialization of the cryptographic module.

11. The use of the Compact Flash Port shall be restricted to loading McAfee signed firmware.

9 Physical Security Policy

9.1 Physical Security Mechanisms

The cryptographic module includes the following physical security mechanisms:

- Production-grade components
- Production-grade opaque enclosure with tamper evident seals (Note: Tamper evident seals are obtained in the FIPS Kit)

9.2 Operator Required Actions

For the module to operate in a FIPS Approved mode, the tamper seals shall be placed by the Admin as specified below. The Admin is also required to periodically inspect tamper evident seals. Table 7 outlines the recommendations for inspecting/testing physical security mechanisms of the module. If evidence of tamper is found during the periodic inspection, the operator should zeroize the module and modify Administrator Passwords upon start up. The operator should contact McAfee for new tamper labels, if necessary.

<table>
<thead>
<tr>
<th>Physical Security Mechanisms</th>
<th>Recommended Frequency of Inspection/Test</th>
<th>Inspection/Test Guidance Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tamper Evident Seals</td>
<td>As specified per end user policy</td>
<td>Visually inspect the labels for tears, rips, dissolved adhesive, and other signs of malice.</td>
</tr>
<tr>
<td>Opaque Enclosure</td>
<td>As specified per end user policy</td>
<td>Visually inspect the enclosure for broken screws, bent casing, scratches, and other questionable markings.</td>
</tr>
</tbody>
</table>
Figure 2 depicts the tamper label locations on the cryptographic module. There are 6 tamper labels and they are circled in yellow.

![Figure 2 – Tamper Label Placement](image)

**10 Mitigation of Other Attacks Policy**

The module has not been designed to mitigate any specific attacks beyond the scope of FIPS 140-2 requirements.
