1. Introduction

1.1. Purpose

This document describes the non-proprietary cryptographic module security policy for 3e Technologies International’s wireless universal products, the 3e-523-F2 & 3e-523-3 Secure Multi-function Wireless Data Points (3e-523-F2 & 3e-523-3) (Hardware Versions: HW V1.0, V1.1, V1.2 (3e-523-F2) and V2.0 (3e-523-3); Firmware Versions: 4.4). This document defines 3eTI’s security policy and explains how the 3e-523-F2 and the 3e-523-3 meet the FIPS 140-2 security requirements. The table below lists the hardware version and the CPU version utilized by the hardware.

</tbody>
</table>

In the FIPS mode of operation, the modules secure all wireless communications with Wi-Fi Protected Access 2 (WPA2). WPA2 is the approved Wi-Fi Alliance interoperable implementation of the IEEE 802.11i security standard. The modules use the following cryptographic algorithm implementations:
- AES
- AES-CCM
- Triple-DES
- SHA-1
- HMAC SHA-1
- FIPS 186 Random Number Generator
- RSA

The cryptographic module security policy consists of a specification of the security rules, under which the cryptographic module shall operate, including the security rules derived from the requirements of the standard. The Cryptographic Modules meet the overall FIPS 140-2 Level 2 requirement as detailed in the table below.

1.2. **Scope**
This document covers the secure operation of the 3e-523-F2 and 3e-523-3, including the initialization, roles and responsibilities of operating the product in a secure, FIPS-compliant manner, and a description of the Security Relevant Data Items (SRDIs). The term “product” in this document is used if both the 3e-523-F2 and the 3e-523-3 apply.

1.3. **Cryptographic Module Definition**
The 3e-523-F2 and the 3e-523-3 are devices which consist of electronic hardware, embedded software and an enclosure. For purposes of FIPS 140-2, the module is considered to be a multi-chip standalone product. The modules are physically bounded by the mechanical enclosure, which is protected by tamper evident tape. The physical cryptographic boundary of either 3e-525-F2 or 3e-523-3 is defined to be the entire enclosure of the module.

The figure below shows the 3e-523-F2.
The figure below shows the 523-3.

![Image of 523-3 module]

**Figure 2 – 3e-523-3**

The 3e-523-3 contains the same printed circuit board as a 3e-523-F2, but the PCB is housed in a weatherproof, ruggedized enclosure. The firmware is the same between the 3e-523-F2 and the 3e-523-3.

### 2. Ports and Interfaces

The module provides one RJ45 Ethernet port and two RF antenna ports that connect to the same radio card inside the module.

Ethernet port is meant to be plugged into a secure IT environment. Data packets coming in and going out of RF antenna ports are encrypted by AES/AES-CCM depending on configuration.

For 523-F2

a. Status output: Ethernet port pins and LED pins
b. Data output: Ethernet port pins and serial port pins and RF on antenna ports
c. Data input: Ethernet port pins and serial port pins and RF on antenna ports
d. Control input: Ethernet port pins and RF on antenna ports
For 523-3

a. Status output: Ethernet port and LED
b. Data output: Ethernet port and serial port and RF on antenna ports
c. Data input: Ethernet port and serial port and RF on antenna ports
d. Control input: Ethernet port and RF on antenna ports

The management interface of the Cryptographic Module (CM) uses HTTPS protocol. During the HTTPS session setup, the Cryptographic Module enforces mutual authentication between the web client and CM by requesting and validating the web client’s certificate. The Cryptographic Officer must configure the CM with proper root certificate and OCSP server address to facilitate this mutual authentication between the web client and the CM.

3. Roles, Services, and Authentication

The 523-F2 and 523-3 series product variants support user identity based operator authentication. There are total of three roles supported by the modules. Two of which are operator roles and the other role is device role. Any operator user can belong to one of the operator roles. The operator user authenticates to the cryptographic module by using username and password and assumes his role upon successful authentication.

The set of services available to each role is defined in this section.

3.1.1. Roles & Services

The product supports the following authorized roles for operators:

**Crypto Officer Role:** The Crypto officer (CO) role performs all security functions provided by the product. This role performs cryptographic initialization and management functions (e.g., module initialization, input/output of cryptographic keys and SRDIs, audit functions and user management). The Crypto officer is also responsible for managing other CO users and the Administrator users. The Crypto officer uses a secure mutually authenticated web-based HTTPS connection to configure the products and authenticates to the module using a username and password.

**Administrator Role:** This role performs general product configuration. No CO security functions are available to the Administrator. The Administrator can also reboot the product if deemed necessary. The Administrator uses a secure mutually authenticated web-based HTTPS connection to configure the products and authenticates to the module using a username and password.
Device Role: The purpose of the device role is to describe other devices as they interact with this Cryptographic Module, including:
  - Other Access Points (connecting in Bridge mode or when the CM is in wireless client mode)
  - WLAN Client

When the product is configured to operate in Access Point/Bridge mode, the other device authenticates to the CM by using:

For Wireless client device:

The client proves its possession of the 256 bit PMK by performing 802.11i defined 4-way handshake protocol or proves its possession of the same encryption key for the static AES encryption mode.

For Bridge device:

The bridge device authenticates with the CM by proving the possession of the same encryption key. The key size is 128 for AES_CCM and 128,192 or 256 bit for AES encryption configuration.

When the product is configured to operate in Wireless Client mode, the other device authenticates to the CM by using:

The other device (Access Point) through 802.11i defined 4-way handshake process proves that it has the same 256 bit PMK as the client obtained through EAP-TLS authentication from the RADIUS server, or manually input into the device.

The Device Role has access to the following services:

For Device Role (WLAN client)
  ➢ Apply Wireless Access Point Security on Data Packet
    ▪ AES
    ▪ 802.11i AES-CCM

For Device Role (AP)
  ➢ Apply Wireless Bridge Encryption on Data Packet
    ▪ AES
    ▪ AES_CCM
  ➢ Communicate with Wireless Client
    ▪ AES_CCM
    ▪ AES
The following table outlines the security-relevant cryptographic functionalities that are provided by the “operator” roles (Crypto Officer and Administrator):

**Table 2 – Operator Role Functionalities**

</tr>
<tr>
<td>Bridging static key</td>
<td>128 bits =&gt; 2^128 = 3.40E38</td>
</tr>
</tbody>
</table>

4. Secure Operation and Security Rules

By factory default, the device is put in FIPS mode with NO security setting, and the radio is turned off.

In order to operate the product securely, each operator shall be aware of the security rules enforced by the module and shall adhere to the physical security rules and secure operation rules detailed in this section.

4.1. Security Rules

The following product security rules must be followed by the operator in order to ensure secure operation:

1. Every operator (Crypto Officer or Administrator) has a user-id on the product. No operator shall violate trust by sharing his/her password associated with the user-id with any other operator or entity.
2. The Crypto Officer shall not share any key, or SRDI used by the product with any other operator or entity.
3. The Crypto Officer shall not share any MAC address filtering information used by the product with any other operator or entity.
4. The operators shall explicitly logoff by closing all secure browser sessions established with the product.
5. The Crypto officer is responsible for inspecting the tamper evident seals. A compromised tape reveals message “OPENED” with visible red dots. Other signs of tamper include wrinkles, tears and marks on or around the label.
6. The Crypto Officer shall change the default password when configuring the product for the first time. The default password shall not be used.
7. The Crypto Officer shall login to make sure encryption is applied in the device.
8. The Crypto Officer shall login to make sure the device is in FIPS mode by logging in the Web UI and checking “Security Mode” in the page header. This header is available on every web GUI page.

9. The Crypto Officer shall not use an ASCII passphrase for the 802.11i PSK (Pre-Shared Key with Passphrase). Instead, the Crypto Officer must use either direct 802.11i PSK key input (Pre-Shared Key with Master Key) or EAP-TLS (802.1x) methods.

10. The Crypto Officer shall configure the CM to enforce mutual authentication between the Web Client and CM for remote management over HTTPs.
4.2. **Physical Security Tamper Evidence**

The difference between the 523-F2 and the 523-3 is that the 523-F2 is intended to be placed into a larger enclosure. The 523-3 has weatherproof enclosure and is a stand-alone unit. Functionally, the two modules operate identically. The material used to cover both modules is production grade and opaque within the visible spectrum.

4.2.1 3e-523-F2

The physical security provided is intended to provide FIPS 140-2 Level 2 physical security (i.e. tamper evidence). The tamper evidence tape is applied at the factory. Crypto Officer should check the integrity of the tape.

The picture below shows the physical interface side of 3e-523-F2 enclosure with tamper-evident seals.

![Figure 3 – 3e-523-F2 with tamper seals](image)
4.2.2 3e-523-3

The physical security provided is intended to provide FIPS 140-2 Level 2 physical security (i.e. tamper evidence).

The figures below show the physical interface sides of 3e-523-3 enclosure with tamper-evident seals.

Figure 4 – 3e-523-3 Physical Interface Side 1

Figure 5 – 3e-523-3 Physical Interface Side 2
5. Security Relevant Data Items
This section specifies the product’s Security Relevant Data Items (SRDIs) as well as the product-enforced access control policy.

5.1. Cryptographic Algorithms

The product supports the following FIPS-approved cryptographic algorithms. The algorithms are listed below, along with their corresponding CAVP certificate numbers.

3e Technologies International Inc. 3eTI CryptoLib (User Space Library) Algorithm Implementation 1.0 (RNG only)
RNG: #583[1, 2]

3e Technologies International Inc. 3eTI OpenSSL Algorithm Implementation 0.9.7-beta3
Triple-DES: #783[1, 2]
AES; #1022[1, 2]
SHS: #976[1, 2]
RSA: #490[1, 2]
HMAC: #571[1, 2]

3e Technologies International Inc. 3eTI CryptoLib (Kernel Module) Algorithm Implementation 1.0
AES; #1021[1]
SHS: #975[1]
HMAC: #570[1]

3e Technologies International Inc. 3eTI Kernel Accelerated Crypto Core (Hardware) Algorithm Implementation 1.0
AES; #1023[2]
SHS: #977[2]
HMAC: #572[2]

Where [1] represents the IXP 420 CPU and [2] represents the IXP425 CPU
The product also supports the following non-Approved but FIPS allowed cryptographic algorithms:
- RSA (key wrapping, key establishment methodology provides 80 bits of encryption strength)
- MD5 hashing in HTTPS over TLS
- AES (Cert. #1021, key wrapping)
- Non-Approved RNG
5.2. Self-tests

POST (Power on Self Test) is performed on each boot-time. On-demand self test is provided over the management interface. Crypto Officer User can command or schedule on-demand test from web GUI.

5.2.1 Power-on Self-tests

OpenSSL Power-on Self Tests

- AES ECB - encrypt/decrypt KAT
- Triple-DES CBC – encrypt/decrypt KAT
- RSA KAT
- SHA-1 KAT
- HMAC-SHA-1 KAT

Crypto-1.0 User Library Power-on Self Tests

- FIPS 186-2 (Appendix 3.1, 3.3) RNG KAT

Kernel Crypto Module Power-on Self Tests

- AES ECB - encrypt/decrypt KAT
- AES CCM KAT
- SHA-1 KAT
- HMAC-SHA-1 KAT

Kernel Crypto Coprocessor Power-on Self Tests (Hardware)

- AES ECB – encrypt/decrypt KAT
- AES CCM KAT
- SHA-1 KAT
- HMAC SHA-1 KAT

Software Integrity Power-on Self Tests

- SHA-1 Integrity Test for firmware
- SHA-1 Integrity Test for bootloader

If any of the Power-on Self-tests fail, the system halts. The operator can attempt to power cycle the module to clear the error condition. Once the error condition has been cleared, the Crypto Officer or Administrator can view the logs to determine the type of failure.

5.2.2 Conditional Self-tests

Whenever a firmware package is uploaded through HTTPS over TLS secure channel, the package integrity check is performed before the firmware can be updated.
The firmware package is wrapped in 3eTI proprietary format and HMAC-SHA1 hashed for integrity check.

Whenever a random number is generated (both FIPS 186-2 Approved and non-Approved), a Continuous Random Number Generator test is performed to ensure the random number is not repeating.

5.2.3 Firmware Integrity Check by bootloader

After device is powered on, the first thing done by bootloader is to check firmware integrity. If the integrity fails, firmware won’t boot. Firmware integrity is also performed at POST (Power On Self Test) during firmware boot up. The bootloader integrity is done at POST, too.

5.3. Cryptographic Keys and SRDIs

The module contains the following security relevant data items:

Table 5 - SRDIs
