1 Module Overview

The StorageTek™ T10000C Tape Drive by Oracle Corporation (‘‘Encrypting Tape Drive’, or ETD) (HW P/N: 316052503; Firmware Version: 1.51.318) is a hardware cryptographic module with a multi-chip standalone physical embodiment as defined by FIPS 140-2. The primary purpose of this device is to provide FIPS 140-2 Level 1 security to data on magnetic tape.

The ETD is intended to be used in conjunction with the Oracle Key Manager, which provides centralized key management. The Oracle Key Manager (formerly called the Key Management System 2, or KMS 2) consists of two or more Key Management Appliances (KMAs). Key Management Appliances are the individual components within the system and in the context of this FIPS 140-2 Security Policy, can be viewed as Key Loaders. For more information on these system components please see the website http://www.oracle.com/technetwork/indexes/documentation/index.html. From the main Website the user selects Storage -> Tape Storage and under Tape Drives selects StorageTek T9x40 and T10000.

The cryptographic boundary of the ETD is the external surface of the tape drive’s commercial-grade metallic enclosure. Figures 1.1 – 1.6 illustrate the cryptographic boundary as defined. Note: Figure 1.2 appears to be upside-down to show bottom plate.

Figure 1.1: Front of T10000C
Figure 1.2: Bottom of T10000C

Figure 1.3: Top of T10000C
Figure 1.4: Rear of T10000C

Figure 1.5: Right side of T10000C
2 Security Level

The ETD meets the overall requirements applicable to Level 1 security of FIPS 140-2, as is detailed in Table 1.

### 3 Modes of Operation (Area 1)

#### 3.1 Approved Algorithms

Once configured per the procedures as defined in Section 3.4 the module is only able to operate in a FIPS 140-2 Approved Mode of operation. Within the FIPS 140-2 Approved Mode of operation the following Approved algorithms are available:

1. AES #1564: T10000C AES used in CCM
2. AES #1565: T10000C KMS Agent AES
3. AES #1566: T10000C AES used in CTR DRBG
4. AES #1567: T10000C AES used in TLS1.0
5. CCM #1569: T10000C CCM Firmware Implementation
6. DRBG #71: T10000C CTR DRBG
7. HMAC #916: T10000C HMAC KMS Agent
8. HMAC #917: T10000C HMAC used in TLS1.0
9. RSA #763: T10000C RSA SigVerPKCS1.5
10. SHA #1389: T10000C SHA-1
11. SHA #1390: T10000C SHA-1 used in TLS1.0
12. AES #1568: T10000C AES Hardware Implementation
13. CCM #1570: T10000C CCM Hardware Implementation

- AES CCM supporting 256-bit keys in both hardware (AES Certificate # 1568) (CCM Certificate #1570) and firmware (AES Certificate # 1564) (CCM Certificate #1569).
- AES ECB encryption (AES Certificate # 1565) as used in CCM encryption in firmware (AES Certificate # 1564, as above).
- RSASSA-PKCS1-v1_5 supporting 2048-bit keys (RSA Certificate # 763) for digital signature verification (firmware load test).
- HMAC SHA-1 (HMAC Certificate # 916) to create the challenge response as part of the certificate service of the KMS 2.x Agent Toolkit.
• SHA-1 (SHS Certificate # 1389) for the following:
  o as part of digital signature verification for the firmware
  o as part of HMAC-SHA-1 (HMAC certificate # 916, as above)
  o for hashing passwords used for authentication
• AES ECB (AES Certificate # 1567) supporting 256-bit keys. Used as part of the AES Key Wrap algorithm to securely establish keying material.
• SP 800-90 CTR DRBG (DRBG Certificate # 71) for generating random numbers used for nonce values and cryptographic keys.
• AES CTR (AES Certificate # 1566) as part of the SP 800-90 CTR DRBG.
• AES CBC mode with 256-bit key (AES Certificate # 1567), used within TLS session between ETD and KMS 2.x.
• HMAC-SHA-1 (HMAC Certificate # 917) with 160-bit key used to protect the integrity of TLS communications between the ETD and KMS 2.x.
• SHA-1 (SHS Certificate #1390)
  o as part of the TLS Key Derivation Functionality.
  o as part of HMAC SHA-1 (HMAC Certificate # 917, as above).

3.2 Non-Approved Algorithms
The cryptographic module supports the following Non-Approved algorithms that are allowed for use within FIPS Approved mode: AES Key Wrap (AES Certificate #1567) used to securely establish media keys (Vendor Affirmed, key establishment methodology provides 256 bits of strength).
• RSAES-PKCS1-V1_5 supporting 2048-bit keys, for RSA public key encryption used to provide FIPS 140-2 allowed key transport within the TLS protocol. Key establishment methodology provides 112 bits of security.
• Non-Deterministic Random Number Generator (NDRNG) (provides entropy input to the SP800-90 DRBG, and random values for use within the TLS protocol).
• MD5, as used in the TLS protocol.

3.3 Determining FIPS Mode
The user can determine whether the ETD is operating in FIPS mode by examining the VOP (Virtual Operator Panel). VOP is an external software application and the primary ETD remote management tool. VOP utilizes ETD services remotely. VOP is described in more detail in the document "Virtual Operator Panel User's Guide" (see [VOPUG]).

The user can tell if the ETD is configured for an Approved mode of operation by verifying that the labels
"Encryption active" and "Running in FIPS mode" are both set to "Yes". If either of these labels is set to "No" then the ETD is not in a FIPS Approved mode.

3.4 Configuring the Drive in FIPS mode

An ETD can only be configured for FIPS mode as a one-time decision taken during the encryption enrollment process. Once an ETD is licensed for encryption, it will remain in either FIPS mode or non-FIPS compliant mode.

FIPS 140-2 configuration of ETD with VOP requires the presence of both an Oracle service representative and the customer. In addition they will need to follow the licensing process as outlined in [KMS2IM] the Oracle Key Manager Administration Guide.

Both the Oracle service representative and the customer (in the role of the Crypto-Officer) shall perform the following actions to enable FIPS mode through VOP:

1. The service representative shall examine the hardware part number on the rear label of the Tape Drive to ensure that it matches the part number as listed in Section 1 of this document.

2. The service representative shall, using VOP, click on the menu item Drive Operations → View Drive Data.

3. The service representative shall select the Version Tab and verify that the firmware version listed is that listed in Section 1 of this document.

4. The service representative shall license the tape drive for encryption using the process from [KMS2IM].

5. The service representative shall set the drive offline by selecting Drive Operations → Set Offline.

6. The service representative shall add the ETD to the KMS 2.x cluster (see [KMS2IM]).

7. The service representative shall bring up the “Configure Drive Parameters” Window by selecting “Drive Data” from the Configure menu of the main VOP window, and in this window the customer (in the role of the Crypto-Officer) shall perform the following:
   a) Set the ”Encryption Mode” field to “Yes”.
   b) Set the “Permanently encrypting” field to “Yes”.
   c) Set the “Set FIPS mode (permanent)” field to “On”.
   d) Enter a valid Agent ID, Pass Phrase, and KMS 2.x IP address (see [KMS2IM]).

8. Click on the “Commit” button. The ETD will then reboot and come up in permanent FIPS mode.

9. Verify that FIPS mode was correctly set by examining the FIPS status (see Section 3.3).

10. The end user must not use SSL 2.0 or SSL 3.0 for secure communications.

4 Ports and Interfaces

This section describes all ports and interfaces supported by the Encrypting Tape Drive. Table 2 below provides a listing of the module’s physical ports and logical interfaces (see [ETDOG] for details).
### Table 2: Ports and Interfaces Description

<table>
<thead>
<tr>
<th>Physical Port</th>
<th>Qty</th>
<th>Logical interface definition</th>
<th>Technical Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB15(RS232)</td>
<td>1</td>
<td>data output, status output, control input</td>
<td>Primarily used for tape library communications. The operator can review the status output to determine if the module has passed or failed different self-tests. The status output from this port consists of status messages indicating failure and success.</td>
</tr>
<tr>
<td>Host Interface</td>
<td>2</td>
<td>data input, data output, status output, control input</td>
<td>This interface is used to transfer user data between the ETD and the host. When the host transfers user data to the ETD through this interface, the ETD encrypts and writes the data to the magnetic media. When the host receives user data from the ETD through this interface, the ETD delivers data read from the magnetic media that has been decrypted by the ETD. For details, see [ETDIM]. The interface can be configured to support one of two protocols: 1) Fibre Channel, in accordance with the Fibre Channel Protocol-3 (FCP-3), SCSI Primary Commands-3 (see [SPC-3]), and SCSI Stream Commands (SSC-3) specifications (see [SSC-3]) 2) FICON, in accordance with the Fibre Channel Single-Byte Command Code Sets-3 Mapping Protocol (FC-SB-3), Revision 1.6 specification (see [FC-SB-3])</td>
</tr>
<tr>
<td>Tape head</td>
<td>1</td>
<td>data input, data output</td>
<td>Provides the interface to the magnetic tape media, where the user data to be encrypted is written to, and where the data to be decrypted is read from. Tape media resides in six possible cartridge types: 1) Standard Data 2) SPORT (reduced length) Data 3) VolSafe (write-once) Data 4) Sport VolSafe Data (reduced length, write-once) 5) Cleaning 6) Diagnostic (used by a service representative).</td>
</tr>
</tbody>
</table>
## Physical Port, Qty, Logical interface definition, Technical Specification

<table>
<thead>
<tr>
<th>Physical Port/Port</th>
<th>Qty</th>
<th>Logical interface definition</th>
<th>Technical Specification</th>
</tr>
</thead>
</table>
| Operator Panel Port  | 1   | status output, control input        | The Bottom cover of the ETD has an Operator Panel connector carrying the following signals:  
A. Four signals to provide status output:  
1. Power Indicator output signal  
2. Activity Indicator output signal  
3. Clean Indicator output signal  
4. Service Indicator output signal  
B. An LCD display output interface. The LCD is used to display ETD status and configuration menu text.  
C. Four switch signals (input).  
1. IPL Switch  
2. Unload Switch  
3. Menu Switch  
4. Select Switch |
| Power Interface      | 1   | power input                         | 100-240 VAC @ 50-60 Hz                                                                                                                                                                                                       |
| Drive Status LED     | 1   | status output                       | Provides status on the overall state of the ETD, The Tape Drive’s user manual includes information regarding the different status that is provided by the drive through the LEDs.                                                 |
| Encryption Status LED| 1   | status output                       | Provides status on the encryption configuration of the ETD.                                                                                                                                                                |
| RJ45(Ethernet)       | 1   | data input, data output, status output, control input | This Primary uses of this interface are to:  
1) Configure the ETD  
2) Deliver encryption keys to the ETD  
3) Obtain ETD status and diagnostic data  
4) Download firmware to the ETD  
5) Deliver status information to an SNMP server. |
5 Identification and Authentication Policy

5.1 Assumption of roles

The ETD cryptographic module supports two distinct operator roles, User and Crypto-Officer (C.O.). Table 3 shows these roles. The module only supports six operator sessions at one time.

Table 3: Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Type of Authentication</th>
<th>Authentication Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>Crypto-Officer</td>

<td>None</td>
</tr>
</tbody>
</table>

6 Definition of Critical Security Parameters (CSPs)

Table 4 describes the CSPs that are contained within the ETD.

Table 4: Description of Critical Security Parameters (CSPs)

<table>
<thead>
<tr>
<th>CSP</th>
<th>Description/Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Media Key (MEKey)</td>
<td>Media Keys are 256-bit AES CCM keys which are generated outside the Tape Drive by the KMS 2.x. An ETD uses an MEKey to encrypt and decrypt the customer bulk data it processes.</td>
</tr>
<tr>
<td>CTR_DRGB</td>
<td>AES-256 key used by SP 800-90 CTR DRBG, along with the 128-bit value $V$, and reseed counter. Used to generate random numbers used for nonce values and cryptographic keys.</td>
</tr>
<tr>
<td>AES Key Wrap Key (AKWK)</td>
<td>An AES Key Wrap Key is a 256-bit AES ECB key used to protect the MEKeys with AES Key Wrap as they enter the ETD. Transported wrapped with the KWKPublicKey, which provides 112 bits of encryption strength.</td>
</tr>
</tbody>
</table>
CSP | Description/Usage
---|---
Dump Encryption Key (DEKey) | A Dump file encryption key is a 256-bit AES CCM key used for encrypting the dump files during generation and storage. Transported wrapped with the KWKPublicKey, which provides 112 bits of encryption strength.
Tape Drive Private Key (TDPrivKey) | The Tape Drive Private Key is a 2048-bit RSA private key used during the TLS handshake to authenticate the Tape Drive to an appliance within a KMS 2.x cluster.
TLS_PM | Premaster Secret for the TLS session. It consists of 2 bytes of version number concatenated with 46 bytes of random data.
TLS_MS | Master Secret for the TLS session; 48 bytes of pseudo-random data generated according to TLS, based on a hash of the premaster secret and nonces.
TLS_EMK | Encrypt MAC Key for TLS, used with HMAC-SHA-1 (160 bits).
TLS_DMK | Decrypt MAC Key for TLS, used with HMAC-SHA-1 (160 bits).
TLS_ECK | Encrypt Crypto Key for TLS. 256-bit key used in AES-CBC mode to encrypt TLS data.
TLS_DCK | Decrypt Crypto Key for TLS. 256-bit key used in AES-CBC mode to decrypt TLS data.

### 6.1 Definition of Public Keys

Table 5 describes the public keys stored with the ETD.

**Table 5: Description of Public Keys within the ETD**

<table>
<thead>
<tr>
<th>Public Key Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA_Cert</td>
<td>CA Certificate public key self-signed by a KMS 2.x cluster. Contains a 2048-bit RSA Public Key for each appliance in a KMS 2.x cluster. Used by the ETD to authenticate the appliance during the TLS handshake.</td>
</tr>
<tr>
<td>Tape Drive Public Key (TDPubKey)</td>
<td>The Tape Drive Public Key is a 2048-bit RSA key used by TLS. The ETD sends this key to the KMS 2.x cluster to authenticate the Tape Drive during the TLS handshake. It is stored within an X.509 certificate within the ETD.</td>
</tr>
<tr>
<td>Key Wrap Key Public Key</td>
<td>The Key Wrap Key Public Key is a 2048-bit RSA public key used to wrap the</td>
</tr>
</tbody>
</table>
### Public Key Name | Description
---|---
(KWKPublicKey) | AES Key Wrap Key.

Dump Encryption Public Key (DEPubKey) | The Dump Encryption Public Key is a 2048-bit RSA public key used to wrap the DEKey. It is stored in an X.509 certificate.

Firmware Signature Public Key (FSPubKey) | The Firmware Signature Public Key is a 2048-bit RSA key used to validate any uploaded firmware.

Firmware Signature Root Certificate Key (FSRootCert) | The Firmware Signature Root Certificate Key is a 2048-bit RSA key within a PEM encoded certificate used to validate the certificate chain within the candidate firmware image.

### 7 Access Control Policy

#### 7.1 Roles and Services

Table 6 shows the services available to each authorized role and CSP access (Crypto-Officer (C.O.), or User). See Section 6 for a description of the keys and CSPs.

**Table 6: Services Authorized for Roles**

<table>

# Access Type Definitions:

- **Use**: The CSP is used within an ETD security function or authentication mechanism.
- **Write**: The CSP is written to internal volatile or persistent memory of the ETD. This is done during the input of a new CSP or the modification of an existing.
- **Generates**: Generates the CSP using the FIPS Approved SP800-90 DRBG.
- **Derives**: The CSP is derived using the Allowed TLS1.0 Key Derivation Function.

The ETD supports the unauthenticated services listed below in Table 7. None of the services modify, disclose, or substitute cryptographic keys and CSPs, or otherwise affect the security of the ETD.

## Table 7: No Role Services

The following services are not associated with a specific role.

<table>
<thead>
<tr>
<th>Name of Service</th>
<th>Service Description</th>
<th>Available On:</th>
</tr>

</table>
### 8 Operational Environment (Area 6)

The FIPS 140-2 Area 6 Operational Environment requirements are not applicable because the ETD functions in a limited operational environment. As such, the module performs a firmware load test (RSA signature verification) to verify the authenticity and integrity of any newly loaded code (Note: New code images running on the hardware platform must be FIPS 140-2 validated as a single module).

### 9 Security Rules

#### 9.1 FIPS 140-2 Security Requirements

This section documents the security rules enforced by the ETD cryptographic module.

1) The cryptographic module shall provide two distinct operator roles. These are the User role and the Crypto-Officer role.

2) When the module has not been placed in a valid role, the operator does not have access to any cryptographic services.

3) The cryptographic module shall encrypt and decrypt sensitive data using the AES-256 CCM algorithm.

4) The cryptographic module shall perform the following tests:

   a) Power-up Self-tests

      i) Cryptographic algorithm tests:

         1) AES ECB KAT (Encrypt/Decrypt)
         2) AES Key Wrap KAT (Wrap/Unwrap)
(3) AES CBC (Encrypt/Decrypt)
(4) AES CCM Firmware Implementation KAT (Encrypt/Decrypt)
(5) AES CCM Hardware Implementation KAT (Encrypt/Decrypt)
(6) SP800-90 CTR DRBG KAT
(7) SHA-1 KAT
(8) HMAC SHA-1 KAT
(9) HMAC SHA-1(TLS) KAT (SHA-1 as used within this HMAC is tested as part of this KAT)
(10) RSASSA-PKCS1-v1_5 Known Answer Test
   ii) Firmware Integrity Test (32 bit CRC)
   iii) CRC check on the keys (32 bit CRC)
   b) Conditional Self-tests:
      i) Firmware Load Test: 2048 bit RSA PKCS1 digital signature verification
      ii) SP800-90 DRBG Continuous Test
      iii) NDRNG Continuous Test
5) An operator may command the module to perform the power up self-test by initiating a power cycle of the module.
6) The cryptographic module inhibits data output during self-tests, zeroization, key generation and error states.
7) Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the module.
8) The module supports concurrent operators.

The operator can determine whether the power-on self-tests tests have passed or failed by observing the Operator Panel (See [ETDOG], Table 2-1 “Operator Panel Indicators”). If the Power Indicator is solid green, then all the power-on self-tests have completed successfully. If a power-on self-test fails, then the Power Indicator LED will continue to flash, and the ETD will report an error and collect dump data, which includes turning on the Service Indicator LED (either flashing or solid).

10 Physical Security

10.1 Physical Security Mechanisms
The ETD multi-chip standalone cryptographic module includes the following physical security mechanisms:
- Production-grade components
- Production-grade metal enclosure
NOTE: The security stickers on the ETD do not provide FIPS-approved security.

11 Mitigation of Other Attacks Policy

The module has not been designed to mitigate any specific attacks.

13 Definitions and Acronyms

AES  Advanced Encryption Standard
CO   Crypto-Officer
Data-At-Rest Data that is stored on non-network attached media. Data-At-Rest in the context of the EDRS system is data stored on magnetic tape.
EDRS  Encrypted Data at Rest Solution
ETD  The Oracle Sun StorageTek T10000C Encrypting Tape Drive.
IPL  Initial Program Load. The process that brings up the ETD after a power-on or reset.
KMA  Key Management Appliance
KMS  Key Management System, which consists of two or more KMAs.
TLS  Transport Layer Security, v1.0, as defined by IETF RFC 2246
User Data Arbitrary data which is being written to or read from magnetic tape.
VOP  Virtual Operator Panel – Software used to configure the ETD
