1. Module Overview

The Accellion Cryptographic Module (SW Version FTALIB_2_0_1) is a software only module that operates in a multi-chip standalone embodiment, as defined in the FIPS 140-2 standard. The physical boundary is defined as being the outer perimeter of the general purpose computer on which the software module is installed. The logical boundary is defined as the collection of the shared libraries which are as follows:

- PERL AES Library: Rijndael.so [Version: 0.05]
- PHP AES Library: libmcrypt.so.4.4.7 [Version: 2.5.7]
- TLS Library: libcrypto.so.1.0.0 [Version: 1.0.1c]
- Core PHP Library: libphp5.so [Version: 5.2.17]
- Utils Binary: fips_utils [Version: 1.1]

The primary purpose for this device is to provide data security for file transfers and sharing.

2. Security Level
The Accellion Cryptographic Module meets the overall requirements applicable to Level 1 security of FIPS 140-2.

3. Modes of Operation
The Accellion Cryptographic Module only supports a FIPS Approved mode of operation; it is placed into FIPS mode when initialized with a valid license key. The user can determine if the cryptographic module is running in FIPS mode via the license page.

**Approved mode of operation**

The Accellion Cryptographic Module supports the following FIPS Approved algorithms within the libraries:

**PERL AES Library**
- AES ECB mode with 128 and 256 bit keys for decryption of the file (Cert. #2317)

**PHP AES Library**
- AES CBC mode with 128 and 256 bit keys for encryption and decryption. Used for decryption of the license, encryption/decryption of the administrator session, and other general encryption/decryption (Cert. #2318)
TLS Library

- AES CBC mode with 128 and 256 bit keys for encryption and decryption in TLS (Cert. #2316)
- Triple-DES TCBC mode using 3-keys for encryption and decryption in TLS (Cert #1460)
- HMAC-SHA-1 and HMAC-SHA-256 for MAC and key derivation in TLS (Cert. #1457)
- SHA-1 and SHA-256 for hashing and key derivation in TLS (Cert. #2003)
- CVL SP 800-135 TLSv1.0/v1.1/v1.2 KDF for deriving TLS Session Keys (Cert. #55)
- RSA with 1024 bit keys for digital signature verification (Cert. #1214)

Core PHP Library

- HMAC-SHA-1 for API token authentication (Cert. #1436)
- SHA-1 for hashing and within HMAC (Cert. #2004)

The module supports the following FIPS allowed algorithms and protocols:

- TLS v1.0/SSL v3.1 and TLS v1.1 for secure communications and key establishment (acting as client or server) with the following cipher suites:
  - TLS_RSA_WITH_AES_128_CBC_SHA
  - TLS_RSA_WITH_AES_256_CBC_SHA
  - TLS_RSA_WITH_3DES_EDE_CBC_SHA
- TLS v1.2 for secure communications and key establishment (acting as client or server) with the following cipher suites:
  - TLS_RSA_WITH_AES_128_CBC_SHA256
  - TLS_RSA_WITH_AES_256_CBC_SHA256
- AES key wrap per the AES Key Wrap Specification (Cert. #2316, key wrapping; key establishment methodology provides 128 bits of encryption strength)
- Triple-DES (Cert. #1460, key wrapping; key establishment methodology provides 112 bits of encryption strength)
- RSA (key wrapping; key establishment methodology provides 80 to 256 bits of encryption strength)
- SSH v2 (no security is claimed)
- MD5 within TLS key derivation (as allowed per IG D.9)

The module supports the following non-FIPS Approved algorithm which does not support any security relevant operations:

- MD5 for hashing (no security claimed)
4. Ports and Interfaces

The physical ports of the module are provided by the general purpose computer on which the module is installed. The module supports the following logical interfaces: data input, data output, control input, and status output. The data input interface consists of the input parameters of the shared libraries' functions. The data output interface consists of the output parameters of the shared libraries' functions. The control input interface consists of the actual functions of the shared libraries. The status output interface includes the return values of the functions of the shared libraries.

5. Identification and Authentication Policy

The Accellion Cryptographic Module supports two distinct operator roles (User, Cryptographic Officer). In compliance with FIPS 140-2 Level 1 standards, the module does not support user authentication for those roles. However, only one role may be active at a time and the module does not allow concurrent operators.

The User and Cryptographic Officer roles are implicitly assumed by the entity accessing services implemented by the module.

User Role: Initialize the module and perform any of the module services. This role has access to all of the services provided by the module.

Cryptographic Officer Role: Installation of the module on the host computer system.

6. Access Control Policy

Roles and Services

Table 2 – Services Authorized for Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Authorized Services</th>
</tr>
</thead>
<tbody>
<tr>
<td>User:</td>
<td><strong>Symmetric encryption/decryption:</strong> This service provides encryption/decryption functionality for AES and TDES ciphers.</td>
</tr>
<tr>
<td></td>
<td><strong>AES key wrapping for key transport:</strong> This service provides key wrapping functionality for file decryption key.</td>
</tr>
<tr>
<td></td>
<td><strong>RSA key wrapping for key transport:</strong> This service provides key wrapping functionality for TLS connection.</td>
</tr>
<tr>
<td></td>
<td><strong>Digital signature:</strong> This service provides functionality to verify digital signatures.</td>
</tr>
<tr>
<td></td>
<td><strong>Keyed Hash (HMAC):</strong> This service provides keyed hash functionality using HMAC-SHA1 or HMAC-SHA-256.</td>
</tr>
<tr>
<td></td>
<td><strong>Message Digest (SHS):</strong> This service provides functionality to generate message digests using SHA-1 or SHA-256.</td>
</tr>
<tr>
<td>Cryptographic Officer Module Installation:</td>
<td>Install the module on the host computer system</td>
</tr>
</tbody>
</table>
The following services are available to any operator without assuming an authorized role:

**Self-Tests:** On bootup of the host GPC and/or module instantiation, automatically runs the self-tests necessary for FIPS 140-2.

**Zeroization:** All the CSPs can be zeroized through Accellion’s Secure File Transfer application.

**Show Status:** The operator can obtain the current status of the module.

### Definition of Critical Security Parameters (CSPs)

The following are CSPs contained in the module:

- **Key Encryption Key (KEK):** This is an AES 128 bit key used for encryption/decryption of the File Decryption Key.
- **License Key:** This is an AES 256 bit key used to decrypt the license file.
- **Session Key:** This is an AES 256 bit key used to encrypt/decrypt administrator session.
- **Accellion TLS Key:** This is a RSA 2048 bit private key used for TLS connections. This key is shipped from the factory and is to be replaced by the Customer TLS Key.
- **Customer TLS Key:** This is a RSA 1024 to 16384 bit private key used for TLS connections. This key is loaded by the customer and replaces the Accellion TLS Key.
- **TLS Session Keys:** The set of ephemeral TDES or AES 128/256 and HMAC keys created for each TLS session.
- **File Decryption Key:** This is an AES 128 or 256 bit key used to decrypt a file stored on the Secure File Transfer Appliance’s hard disk.
- **HMAC Key:** This key is used by the login API through an API based authentication. This is one of the available authentication modes.
- **HMAC Software Integrity Key:** This key is used to calculate the HMAC-SHA1 digest of the module which is then used in the software integrity test.

### Definition of Public Keys:

The following are the public keys contained in the module:

- **RSA Public Key:** This is a RSA 1024 bit public key used to check the signature of the license.
- **RSA Public Key – TLS:** This is a RSA 1024 to 16384 bit public key used in TLS which can be replaced by the customer.
- **Third Party RSA Public Keys – TLS:** This is a RSA 1024 to 16384 bit public key which is sent from third party users and used in TLS communications.
### Definition of CSPs/Public Key Modes of Access

Table 3 defines the relationship between access to CSPs/Public Keys and the different module services. The modes of access shown in the table are defined as follows:

- **Use (U):** This operation uses the identified CSP.
- **Zeroize (Z):** This operation actively overwrites the identified CSP.

7. Operational Environment

The Accellion Cryptographic Module is a software module that runs on an underlying modifiable operational environment and is installed on a general purpose computer. The module is composed of the shared libraries described in Section 1 above.

When a crypto module is implemented in Accellion's SFTA environment, the SFTA application is the user of the cryptographic module. The SFTA application makes the calls to the cryptographic module. Therefore, the SFTA application is the single user of the cryptographic module, and satisfies the FIPS 140-2 requirement for a single user mode of operation, even when the SFTA application is serving multiple clients.

The Accellion Cryptographic Module has been tested on Red Hat Enterprise Linux 5.

8. Security Rules

The Accellion Cryptographic Module’s design corresponds to the cryptographic module’s security rules. This section documents the security rules enforced by the cryptographic module to implement the security requirements of this FIPS 140-2 Level 1 module.

1. The cryptographic module shall provide the following distinct operator roles:
   - User role
   - Cryptographic Officer role

2. When the module has not been placed in a valid role, the operator shall not have access to any cryptographic services.

3. The cryptographic module shall encrypt message traffic using the TLS v1.0/SSL v3.1, TLS v1.1, or TLS v1.2 protocol.

4. The cryptographic module shall perform the following tests:
   A. Power up Self-Tests:
      1. Cryptographic algorithm tests:
         PERL AES Library
            a. AES ECB decryption KATs (for decryption of the file) (2 tests for both 128 bit and 256 bit)
         PHP AES Library
            b. AES CBC encryption/decryption KATs (for decryption of the license, encryption/decryption of the administrator session, and other general encryption/decryption) (2 tests)
         TLS Library
            c. AES CBC encryption/decryption KATs (for encryption/decryption in TLS) (2 tests)
            d. TDES encryption/decryption KAT (used with TLS implementation)
e. HMAC-SHA-1 and HMAC-SHA-256 (used with TLS implementation)
f. SHA-1 and SHA-256 KAT (used with TLS implementation)
g. SP 800-135 TLS KDF KAT (used with TLS implementation)
h. RSA verify KAT (used with TLS implementation)

Core PHP Library
i. HMAC-SHA-1 KAT (for API token authentication)
j. SHA-1 KAT (used with HMAC implementation)

Utils Binary
k. AES Key Wrap KAT
l. AES Key Unwrap KAT

2. Software Integrity Test – HMAC-SHA-1

3. Critical Functions Tests: None

B. Conditional Self-Tests: None.

5. At any time the cryptographic module is in an idle state, the operator shall be capable of commanding the module to perform the power-up self-test. If a self-test fails, the module provides the following error: “Failed FIPS test when running. Go to FIPS error state.” The module is then uninstalled and the GPC is rebooted.

6. Status information shall not contain CSPs or sensitive data that if misused could lead to a compromise of the module.

7. Third party clients using this module shall restrict their TLS ciphers suites to those listed in Section 3 of this document.

9. Physical Security Policy
The Accellion Cryptographic Module is a software module intended for use with Red Hat Enterprise Linux 5; therefore, the physical security requirements of FIPS 140-2 are not applicable.

10. Mitigation of Other Attacks Policy
The module has not been designed to mitigate specific attacks outside of the scope of FIPS 140-2.
