1. Module Overview

The following summarize key features of the Module:

- The Voltage Cryptographic Module v.5.0 (Version 5.0) is a software-only cryptographic module embodied as a shared library binary that executes on general-purpose computer systems. The specific operating systems and versions that were validated are specified in the "Operational Environment" section of this document.
- The Module is accessible to client applications through an application-programming interface (API).
- The Module provides a FIPS mode of operation, which is described in the "Approved Mode of Operation" section of this document.
- For the purposes of FIPS 140-2, the Module is classified as a multichip standalone module.
- The Module provides program interfaces for data input and output. Figure 1 below illustrates these interfaces as well as defining the cryptographic boundary.

![Figure 1 – Block diagram of the Module](image-url)
The Module was tested on the general-purpose operating systems and operating environments listed as follows:

- CPU Intel(R) Core(TM) i7-3770 with AES-NI w/ CentOS Linux release 7.0.1406
- CPU Intel(R) Core(TM) i7-3770 w/o AES-NI w/ CentOS Linux release 7.0.1406
- CPU Intel Itanium 9300, model NB54000c w/ HP NonStop TNS/E J06.19.00 – OSS
- CPU Intel Xeon E5-2600 v2 with AES-NI, model NS7 X1 w/ HP NonStop TNS/X L15.08.00 – OSS
- CPU Intel Itanium 9300, model NB54000c w/ HP NonStop TNS/E J06.19.00 – Guardian
- CPU Intel Xeon E5-2600 v2 with AES-NI, model NS7 X1 w/ HP NonStop TNS/X L15.08.00 – Guardian
- CPU Intel Xeon E5-2600 v2 w/o AES-NI, model NS7 X1 w/ HP NonStop TNS/X L15.08.00 – OSS
- CPU Intel Xeon E5-2600 v2 w/o AES-NI, model NS7 X1 w/ HP NonStop TNS/X L15.08.00 – Guardian
2. Security Level
The Module meets the overall requirements applicable to Level 1 security of FIPS 140-2. Some aspects of the Module meet the requirements of higher levels, as shown in below.

Table 1: Module Security Level Specification

<table>
<thead>
<tr>

3. Modes of Operation
The Module supports two modes of operation: FIPS Approved mode and non-Approved mode.

3.1 Approved mode of operation
The initialization happens when the calling application invokes FIPS_mode_set(), which returns a "1" for success and "0" for failure. The fips_mode_set() function verifies the integrity of the runtime executable using a HMAC-SHA1 digest computed at build time. If the digest matches, the power-up self-tests are performed automatically. If the power-up self-tests are successful, FIPS_mode_set() sets the FIPS_mode flag to TRUE and the module is in a FIPS Approved mode of operation.

The Module conforms to the IG 9.10 requirements by providing a Default Entry Point (DEP). The DEP is automatically executed, without requiring operator intervention (calling application).

In FIPS Approved mode, the Module supports the Approved algorithms listed in Table 2:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Modes of Operation</th>
<th>Certificate #</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECDSA (FIPS 186-4)</td>
<td>SigGen: P-224, 256, 384, 521</td>

<td></td>
</tr>
<tr>
<td>DSA (FIPS 186-4)</td>
<td>Sign/Verify</td>
<td>1042, 1044, 1050, 1059, 1060</td>
</tr>
<tr>
<td>Two-key Triple-DES</td>
<td>Decrypt for TECB, TCBC, TCFB1, TCFB8, TCFB64, TOFB</td>
<td>1915, 1916, 2091, 2117, 2137, 2138</td>
</tr>
<tr>
<td>Three-Key Triple-DES</td>
<td>Encrypt/Decrypt for TECB, TCBC, TCFB1, TCFB8, TCFB64, TOFB</td>
<td>2169</td>
</tr>
<tr>
<td>SHA-1, SHA-224, SHA-256, SHA-384, SHA-512</td>
<td>Byte Oriented</td>
<td>2791, 2792, 3131, 3166, 3210, 3211</td>
</tr>
<tr>
<td>AES – 128-, 192- and 256-bit keys are supported</td>
<td>ECB, CBC, OFB, CFB1</td>
<td>3372, 3373, 3761, 3843, 3894, 3895</td>
</tr>
<tr>
<td>AES – 128-, 192- and 256-bit keys are supported</td>
<td>GCM</td>
<td>3410, 3411, 3761, 3843, 3894, 3895</td>
</tr>
<tr>
<td>AES – 128-, 192- and 256-bit keys are supported</td>
<td>CMAC Generation/Verification</td>
<td>3918</td>
</tr>
<tr>
<td>SP800-38G FPE – 128, 192 and 256-bit keys are supported (vendor affirmed)</td>
<td>Encrypt/decrypt for AES-FF1 (vendor affirmed: SP800-38G)</td>
<td>Prerequisite: 3372, 3373, 3761, 3843, 3894, 3895 (AES-FF1, vendor affirmed: SP800-38G)</td>
</tr>
<tr>
<td>SP800-132 PBKDF2 (vendor affirmed)</td>
<td>Password based key derivation for storage applications (vendor affirmed: SP800-132)</td>
<td>Prerequisite: 2791, 2792, 3131, 3166, 3210, 3211</td>
</tr>
</tbody>
</table>
Operators should reference the transition tables that will be available at the CMVP Web site (http://csrc.nist.gov/groups/STM/cmvp/). The data in the tables will inform users of the risks associated with using a particular algorithm and a given key length.

In FIPS Approved mode, the Module also supports non-Approved algorithms in limited uses as follows:

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Limitations to Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSA key wrap</td>
<td>RSA (key wrapping; key establishment methodology provides 112 bits of encryption strength)</td>
</tr>
<tr>
<td>EC Diffie-Hellman</td>
<td>EC Diffie-Hellman (key agreement; key establishment methodology provides between 112 and 256 bits of encryption strength)</td>
</tr>
</tbody>
</table>

In FIPS Approved mode, the Module supports the following vendor affirmed algorithms:
- SP800-132 PBKDF2: shall only be used in storage applications.
- SP800-38G AES-FF1: the Module supports the following parameter lengths:
  - 128-, 192- and 256-bit keys
  - the underlying AES block cipher has a block size of 128-bits
  - \( maxTlen < 2^{32} - 1 \)
    - \( maxTlen \) is the maximum length of the tweak \( T \), where the tweak \( T \) is the input parameter to the encryption and decryption functions whose confidentiality is not necessarily protected by the mode
  - \( 0 \leq t < maxTlen \)
    - \( t \) is the byte length of the tweak \( T \)
  - \( radix \in [2 \ldots 2^{16}] \)
    - the number of characters in a given alphabet is the base, denoted by \( radix \), thus \( radix \geq 2 \)
  - \( 2 \leq minlen \leq maxlen < 2^{32} \)
    - range of supported message lengths, \([minlen \ldots maxlen]\)
  - \( radix^{minlen} \geq 100 \)
• the parameters \textit{radix} and \textit{minlen} shall meet this requirement
3.2 Non-Approved mode of operation

The following table lists services implemented by the module that shall not be used when operating in the FIPS Approved mode of operation. If any of these services are used, the module is no longer considered to be in the FIPS Approved mode of operation. In the event that the Cryptographic Officer or User violates or attempts to violate such restrictions, the module is in strict violation of this Security Policy and is deemed fully non-compliant and unfit for service to protect sensitive unclassified data with cryptography. Both the Crypto Officer Role and the User Role have access to the non-Approved services listed in table below.

<table>
<thead>
<tr>
<th>Roles</th>
<th>Function</th>
<th>Algorithm Options</th>

</tr>
</tbody>
</table>
4. Ports and Interfaces

The Module restricts all access to its Critical Security Parameters (CSPs) through the API calls listed in the "Roles and Services" section of this document. This API acts as the logical interface to the Module.

The physical ports of the general-purpose computer on which the Module runs, such as keyboards, hard disks, displays, etc., provide a means to access the Module, but the logical interface to the Module is just via the API itself.

Table 5 lists the logical interfaces to the Module.

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Input</td>
<td>Parameters passed to the Module through API calls.</td>
</tr>
<tr>
<td>Data Output</td>
<td>Data returned by the Module through API calls.</td>
</tr>
<tr>
<td>Control Input</td>
<td>Control Input – API function calls.</td>
</tr>
<tr>
<td>Status Output</td>
<td>Error and status codes returned by API calls.</td>
</tr>
</tbody>
</table>

The Module does not support a cryptographic bypass mode.

All Data Output is inhibited during an error state. Data Output is also inhibited during the self-test and zeroization processes.

The following is the mapping of the physical ports/interfaces to the logical ports/interfaces available to the module:

1. Power supply unit: Provides power to the cryptographic module: Power Input
2. Video connector: Connects a monitor to the general purpose computing platform: Data Output, Status Output.
3. Serial connector: connects peripheral general purpose I/O devices such as mouse, keyboard, and monitor: Data Input, Data Output, Control Input, and Status Output
4. USB connectors: Connects peripheral general purpose I/O devices such as mouse, keyboard, and monitor: Data Input, Data Output, Control Input, and Status Output.
5. Ethernet connectors: provides network connectivity: Data Input, Data Output, Control Input, and Status Output.
5. Identification and Authentication Policy

This section describes the identification and authentication policy of the Module. The Module supports two distinct operator roles (User and Crypto Officer). See section 6.1 Roles and Services.

The Module does not support a Maintenance role. The role of the operator of the Module is identified implicitly from the API function being called, as shown in Table 8. The Module is designed to meet the requirements specified for a Level 1 software-only module as per FIPS 140-2 and therefore does not support operator authentication, as shown in Table 7.

<table>
<thead>

<td>N/A</td>
</tr>
</tbody>
</table>
6. Access Control Policy
This section describes the access control policy of the Module.

6.1 Roles and Services
The Module operator is any software application that is linked to the Module shared library.

The Module supports two roles: User and Crypto Officer. An operator accesses both roles while using the Module and the means of access is the same for both roles. A role is implicitly assumed based on the services that are accessed. These roles are defined as the following:

• User: allowed to perform all services provided by the Module.
• Crypto Officer: allowed to perform all services provided by the Module and also responsible for the installation of the module.

The Crypto Officer is any entity that can install the module library onto a general purpose computer system, configure the operating system and validate the compliance of the module. This role is implicitly selected when the Module is installed or the operating system is configured.

The Crypto Officer must have permission to write the library comprising the Module into an operating system directory. This typically requires administrator access to the operating system.

The run self-tests service is ran automatically when the Module is loaded.

6.2 Service Inputs and Outputs
The following table summarizes which CSPs are accessed by each service and how the CSP is accessed on behalf of the operator when the service is performed in FIPS mode of operation. All services are available to both the Crypto Officer and User roles.

<table>

6.3 Definition of Critical Security Parameters (CSPs)

The following list enumerates the secret keys, private keys, and CSPs contained in the Module:

- AES Secret Key (128-, 192- and 256-bit)
- Two-key Triple-DES Secret Key (112-bit)
- DSA Private Key (2048-bit)
- RSA Private Signature Key (2048-bit)
- RSA Private Key for Key Transport (2048-bit)
- ECDSA Private Signature Key (P-224, P-256, P-384, P-521)
- SP800-108 KBKDF Key Derivation Key (256-bit)
- SP800-108 KBKDF Internal State
- ECC CDH Private Key (P-224, P-256, P-384, P-521)
- ECC CDH Shared Secret (P-224, P-256, P-384, P-521)
- DRBG V Value
- DRBG C Value
- HMAC Secret key (112-, 192- and 256-bit)
- SP800-132 PBKDF2 Master Key (256-bit)
- SP800-132 PBKDF2 Internal State
- Password (64-bit)
- AES CMAC Key (128-, 192- and 256-bit)
- Three-Key Triple-DES Secret Key (168-bit)

The following list enumerates the public keys contained in the Module:

- DSA Public Key (1024- or 2048-bit)
- RSA Public Signature Key (2048-bit)
- RSA Public Key for Key Transport (2048-bit)
- ECDSA Public Signature Key (P-224, P-256, P-384, P-521)
- ECC CDH Public Key (P-224, P-256, P-384, P-521)

6.4 Definition of CSPs Modes of Access

Table 9 defines the relationship between access to CSPs and the different Module services. The modes of access shown in the table are defined as follows:

<table>
<thead>
<tr>
<th>Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create</td>
<td>An object is created</td>
</tr>
<tr>
<td>Destroy</td>
<td>An object is destroyed and memory that it used is released</td>
</tr>
<tr>
<td>Read</td>
<td>Data stored by an object is accessed for use</td>
</tr>
<tr>
<td>Write</td>
<td>An object is modified</td>
</tr>
</tbody>
</table>
7. Operational Environment
The operational environment for the Module is a “modifiable operational environment”.

The FIPS 140-2 Operational Environment requirements for Security Level 1 are satisfied in the following ways:

When the Module is operated in FIPS approved mode, the environment is restricted to a single operator mode of operation (i.e., concurrent operators are explicitly excluded). The tested operating systems separate user processes into separate address spaces, where each space is logically separated from any other address space by the operating systems and the hardware on which it runs. The Module runs entirely within the address space of the calling application so it implicitly satisfies the requirement for a single user mode of operation.

Processes that are spawned by the Module are owned by the Module and are not owned by external processes/operators. Non-cryptographic processes shall not interrupt the Module during execution.

The Module software is installed in a form that protects the software and executable code from unauthorized disclosure and modification.

8. Security Rules
The following rules must be followed when operating the Module in Approved mode.

1. The Module must be used as described in this document.
2. Installation of the Module is the responsibility of the Crypto Officer.
3. Before the Module can be used in Approved mode, it must be initialized as described in the "Approved Mode of Operation" section of this document.
4. Only Approved cryptographic algorithms as enumerated in the "Approved Mode of Operation" section of this document may be used.
5. The Module does not perform key generation.
6. The Module inhibits Data Output during self-tests and error states. The Data Output interface is logically disconnected from the processes performing self-tests and zeroization.
7. The zeroization process must be implemented using the appropriate API function.
8. The Module is designed to satisfy the requirements of FIPS 140-2 Level 1, therefore the Module does not provide authentication mechanisms.
9. The Module conforms to the EMI/EMC requirements specified by 47 Code of Federal Regulations, Part 15, Subpart B, Unintentional Radiators, Digital Devices, Class B (i.e., for Home use) which vacuously satisfies Class A.
10. The cryptographic module fully implements the SP800-90A Section 11.3 requirements, and therefore meets the requirements of SP800-90A Section 11.3.
12. Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the Module.
13. The Module does not support a maintenance interface or role.
14. The Module does not support manual key entry.
15. The Module does not support bypass mode.
16. The Module does not enter or output plaintext CSPs.
17. The Module does not output intermediate key values.
18. The Module enforces logical separation of all data inputs, data outputs, control inputs, and status outputs.
19. The general purpose-computing platform includes a power port.
20. Roles are implicitly assumed based upon the service requested.
21. The Module performs the following self-tests:
   a  Power up Self-Tests:
      i  Cryptographic Known Answer Tests (KAT):
         1  DRBG KAT
         2  SHA-1 KAT (Hashing)
         3  HMAC-SHA1 KAT (Hashing)
         4  HMAC-SHA256 KAT (Hashing)
5 HMAC-SHA512 KAT (Hashing)
6 AES (256-bit) KAT (encrypt) in GCM
7 AES (256-bit) KAT (decrypt) in GCM
8 AES (128-bit) KAT (decrypt) in ECB
9 AES (128-bit) KAT (encrypt) in ECB
10 AES (128-, 192-, 256-bit) KAT (generation) in CMAC
11 AES (128-, 192-, 256-bit) KAT (verification) in CMAC
12 Three-key Triple-DES KAT (encrypt) in ECB mode
13 Three-key Triple-DES KAT (decrypt) in ECB mode
14 RSA 2048-bit with SHA-256 KAT (signature generation)
15 RSA 2048-bit with SHA-256 KAT (signature verification)
16 ECDSA P-224 with SHA-512 Pairwise Consistency Test (sign/verify)
17 DSA 2048-bit with SHA-384 Pairwise Consistency Test (sign/verify)
18 SP800-108 KBKDF with HMAC-SHA256 KAT in CTR mode
19 SP800-132 PBKDF2 with HMAC-SHA256 KAT

b Conditional Self Tests:
   i Continuous Random Number Generator Tests: RNG and DRBG Tests
   ii Manual Key Entry Test: N/A
   iii Bypass Test: N/A
   iv Pairwise Consistency Test: N/A
9. Physical Security Policy
The Module is a software module and the physical security requirements are not applicable.

Table 10: Inspection/Testing of Physical Security Mechanisms

11. Definitions and Acronyms
The following paragraphs define the acronyms used in this document.

AES. Advanced Encryption Standard secret key algorithm. See [FIPS-197].
API. Application Programming Interface
CBC. Cipher Block Chaining mode
CFB. Cipher Feedback mode
CSP. Critical Security Parameters
DES. Data Encryption Standard. See [FIPS-46-3].
DRBG. Deterministic Random Bit Generator.
DSS. Digital Signature Standard. See [FIPS-186-4]
ECB. Electronic Codebook mode
EMI. Electromagnetic Interference
EMC. Electromagnetic Compatibility
FIPS. Federal Information Processing Standards of NIST.
IV. Initialization Vector
KDF. Key Derivation Function See [SP800-108, SP800-132]
NIST. National Institute of Standards and Technologies.
OFB. Output Feedback mode
SHA-1. Secure Hash Algorithm revision 1. See [FIPS-180-4].
Appendix A: Critical Security Parameters and Public Keys
A.1 Private Keys
The module supports the following secret keys, private keys, and CSPs:

1. AES Secret Key (128-, 192- and 256-bit)
   - Description: 128-, 192- and 256-bit AES secret keys are used in ECB, CBC, OFB, GCM, CFB1, CMAC and FF1 mode for encrypt/decrypt services
   - Generation: N/A
   - Establishment: N/A
   - Storage: In RAM as plaintext
   - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
   - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
   - Entity: Process
   - Zeroization: Power off or actively overwritten by calling program

2. Two-key Triple-DES Secret Key (112-bit)
   - Description: 112-bit Triple-DES secret keys are used in TECB, TCBC, TOFB, TCFB1, TCFB8, TCFB64, and TOFB mode for decrypt services
   - Generation: N/A
   - Establishment: N/A
   - Storage: In RAM as plaintext
   - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
   - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
   - Entity: Process
   - Zeroization: Power off or actively overwritten by calling program

3. DSA Private Key (2048-bit)
   - Description: 2048-bit DSA private key used for digital signature generation
   - Generation: N/A
   - Establishment: N/A
   - Storage: In RAM as plaintext
   - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
   - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
   - Entity: Process
   - Zeroization: Power off or actively overwritten by calling program

4. RSA Private Signature Key (2048-bit)
   - Description: 2048-bit RSA private key used for digital signature generation
   - Generation: N/A
   - Establishment: N/A
   - Storage: In RAM as plaintext
   - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
   - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

5. RSA Private Key for Key Transport (2048-bit)
- Description: 2048-bit RSA private key used for key transport
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

6. ECDSA Private Signature Key (P-224, P-256, P-384, P-521)
- Description: ECDSA (P-224, P-256, P-384, P-521) key used for digital signature generation
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

7. SP800-108 KBKDF Key Derivation Key (256-bit)
- Description: 256-bit SP800-108 KBKDF key used in CTR mode for deriving keys
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

8. SP800-108 KBKDF Internal State
- Description: Internal State of the SP800-108 KBKDF
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program
9. ECC CDH Private Key (P-224, P-256, P-384, P-521)
- Description: ECC CDH (P-224, P-256, P-384, P-521) private key
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

10. ECC CDH Shared Secret (P-224, P-256, P-384, P-521)
- Description: ECC CDH (P-224, P-256, P-384, P-521) shared secret for the ECC CDH private key
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

11. DRBG V Value
- Description: Internal state of the DRBG: 440 bits (for SHA-256 construction) or 888 bits (for SHA-512 construction)
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

12. DRBG C Value
- Description: Internal state of the DRBG: 440 bits (for SHA-256 construction) or 888 bits (for SHA-512 construction)
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program
13. HMAC Secret key (112-, 192- and 256-bit)
   - Description: 112-, 192- and 256-bit HMAC secret keys are used for message
     authentication services
     - Generation: N/A
     - Establishment: N/A
     - Storage: In RAM as plaintext
     - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the
       calling application entering the key is considered as not applicable.
     - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the
       module outputting the key to the calling application is considered as not applicable.
     - Entity: Process
     - Zeroization: Power off or actively overwritten by calling program

14. SP800-132 PBKDF2 Master Key (256-bit)
   - Description: 256-bit SP800-132 PBKDF2 key using HMAC-SHA-256 for deriving keys;
     for use by Storage Based Applications only
     - Generation: N/A
     - Establishment: N/A
     - Storage: In RAM as plaintext
     - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the
       calling application entering the key is considered as not applicable.
     - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the
       module outputting the key to the calling application is considered as not applicable.
     - Entity: Process
     - Zeroization: Power off or actively overwritten by calling program

15. SP800-132 PBKDF2 Internal State
   - Description: Internal State of the SP800-132 PBKDF2; for use by Storage Based
     Applications only
     - Generation: N/A
     - Establishment: N/A
     - Storage: In RAM as plaintext
     - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the
       calling application entering the key is considered as not applicable.
     - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the
       module outputting the key to the calling application is considered as not applicable.
     - Entity: Process
     - Zeroization: Power off or actively overwritten by calling program

16. Password (64-bit)
   - Description: 64-bit Password used to derive keying material for SP800-132 PBKDF2; for
     use by Storage Based Applications only
     - Generation: N/A
     - Establishment: N/A
     - Storage: In RAM as plaintext
     - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the
       calling application entering the key is considered as not applicable.
     - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the
       module outputting the key to the calling application is considered as not applicable.
     - Entity: Process
     - Zeroization: Power off or actively overwritten by calling program
17. AES CMAC Key (128-, 192- and 256-bit)
- Description: 128-, 192- and 256-bit AES secret keys are used in CMAC mode for generation/verification services
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

18. Three-key Triple-DES Secret Key (168-bit)
- Description: 168-bit Triple-DES secret keys are used in TECB, TCBC, TOFB, TCFB1, TCFB8, TCFB64, and TOFB mode for encrypt and decrypt services
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
- Zeroization: Power off or actively overwritten by calling program

A.2 Public Keys
The module supports the following public keys:

1. DSA Public Key (1024- or 2048-bit)
- Description: 1024- or 2048-bit DSA public key used for digital signature verification
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process

2. RSA Public Signature Key (2048-bit)
- Description: 2048-bit RSA public key used for digital signature verification
- Generation: N/A
- Establishment: N/A
- Storage: In RAM as plaintext
- Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
- Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
- Entity: Process
3. RSA Public Key for Key Transport (2048-bit)
   - Description/Usage: 2048-bit RSA public key used for key transport
   - Generation: N/A
   - Establishment: N/A
   - Storage: In RAM as plaintext
   - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
   - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
   - Entity: Process

4. ECDSA Public Signature Key (P-224, P-256, P-384, P-521)
   - Description: ECDSA (P-224, P-256, P-384, P-521) public key used for digital signature verification
   - Generation: N/A
   - Establishment: N/A
   - Storage: In RAM as plaintext
   - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
   - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
   - Entity: Process

5. ECC CDH Public Key (P-224, P-256, P-384, P-521)
   - Description: ECC CDH (P-224, P-256, P-384, P-521) public key
   - Generation: N/A
   - Establishment: N/A
   - Storage: In RAM as plaintext
   - Entry: N/A - the key is entered by the calling application; as per FIPS 140-2 IG 7.7 the calling application entering the key is considered as not applicable.
   - Output: N/A - the key is output to the calling application; as per FIPS 140-2 IG 7.7 the module outputting the key to the calling application is considered as not applicable.
   - Entity: Process
