1. Module Overview

The Standalone IMB cryptographic module (Firmware Version 2.5 with Security Manager Firmware Version 1.5.0; Hardware Version: GDC-IMB-v3, R12), hereafter referred to as the cryptographic module or module, is a Security Processor Block, Type 1, designed in accordance with FIPS 140-2 and the Digital Cinema Initiatives (DCI) Digital Cinema System Specification. For FIPS 140-2 purposes, the IMB is defined as a multi-chip embedded cryptographic module encased in a hard, opaque removable enclosure with tamper detection and response circuitry.

The images below depict the cryptographic module; all components not contained within the metal enclosure (security region) are explicitly excluded from the requirements of FIPS 140-2 as they are non-security relevant and have no impact on the overall security of the module. Excluded items fall into the following non-security relevant categories:

- Power Supply
- Unconnected Components and Test Points
- Mechanical Connections
- Video and Audio Components

Figure 1 - Image of the GDC-IMB-v3 (Top)  Figure 2 - Image of the GDC-IMB-v3 (Bottom)
2. Security Level
The cryptographic module meets the overall requirements applicable to FIPS 140-2 Level 2.

3. Modes of Operation

Approved mode of operation
The module supports the following Approved and allowed algorithms in the Approved mode of operation:

- AES-128 CBC, Decrypt only (Cert. #2148)
- AES 128, 192, 256 ECB, CBC, CFB8, CFB128, OFB modes (Cert. #3938)
- SHA-1 (Cert. #1869)
- SHA-1, -224, -256, -384, -512 (Cert. #3247)
- SP800-90A CTR_DRBG (Cert. #1145)
- RSA FIPS 186-2 Signature Verification, FIPS 186-4 Signature Generation/Verification (Cert. #2012)
- HMAC-SHA-1 (Cert. #1315)
- HMAC-SHA-1, -224, -256, -384, -512 (Cert. #2560)
- TLS KDF (CVL Cert. #785); TLS has not been reviewed or tested by the CAVP and CMVP
The module supports the following non-Approved algorithms allowed for use in the Approved mode of operation.

- RSA (key wrapping, key establishment methodology provides 112-bits of encryption strength)
- HW NDRNG, allowed for seeding the DRBG
- MD5, allowed for use exclusively within TLS

**Non-Approved mode of operation**

The module only supports EC-Diffie-Hellman in the non-Approved mode of operation to support legacy equipment. The module is always in an Approved mode of operation, except when status is explicitly retrieved from an external digital cinema projector.

### 4. Ports and Interfaces

The cryptographic module provides the following physical ports and logical interfaces:

- **RS-232 (Qty. 2):** Status Output
- **PCle to SOM:** Data Input, Data Output, Control Input, Status Output
- **Projector tamper switch input (Qty. 2):** Control Input
- **Ethernet (Qty. 3):** Data Input, Data Output, Control Input, Status Output
- **GPIO (Qty. 4):** Data Output, Control Input, Status Output
- **AES-Audio output (Qty. 3):** Data Output
- **LVDS video output:** Data Output
- **LTC (Linear Time Code) I/O (Qty. 2):** Data Input, Data Output
- **Video ref in/out (Qty. 2):** Data Input, Data Output
- **SDI In (Qty. 2):** Data Input
- **Reset:** Control Input
- **HDMI in:** Data Input
- **LED (Qty. 4):** Status Output
- **Battery (Qty. 2):** Power Input
- **USB (Qty. 2):** Data Input, Data Output, Control Input
- **eSata (Qty. 2):** Data Input, Data Output
5. Identification and Authentication Policy

Assumption of roles

The cryptographic module supports two distinct operator roles, which are the User and Cryptographic-Officer roles.

<table>
<thead>
<tr>
<th>Role</th>
<th>Type of Authentication</th>
<th>Authentication Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cryptographic-Officer</td>
<td>Identity-based operator authentication</td>
<td>2048-bit Digital Signature</td>
</tr>
<tr>
<td>User</td>
<td>Identity-based operator authentication</td>
<td>2048-bit Digital Signature</td>
</tr>
</tbody>
</table>

Table 3 – Strengths of Authentication Mechanisms

<table>
<thead>
<tr>
<th>Authentication Mechanism</th>
<th>Strength of Mechanism</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital Signature</td>
<td>The strength of a 2048-bit RSA key is known to be 112-bits. Therefore, the strength of a 2048-bit digital signature is $1/2^{112}$, which is less than $1/1,000,000$. In a worst case scenario, the module can perform 4725 signature verifications per minute, which does not include network limitations or timing constraints. Therefore, the probability that multiple attacks within a given minute will be successful is $4725/2^{112}$.</td>
</tr>
</tbody>
</table>

Roles and Services

Table 4 – Services Authorized for Roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Authorized Services</th>
</tr>
</thead>
</table>
| Cryptographic-Officer | • Load Firmware: Install a firmware upgrade.  
                         • Import MB Private Key: Update the MB Private Key.                                                                                          |
| User                  | • Get Time: Retrieve current time.  
                         • Update Time: Adjust current time.  
                         • Import KDM: Ingest a new Key Delivery Message for content playback.  
                         • Purge KDM: Remove the identified KDM.  
                         • Check KDM: Verify the validity of a KDM for playback.  
                         • Setup CPL: Prepare to playback a Composition Playlist.  
                         • Purge All KDM: Remove all KDMs.  
                         • Query KDM All: List the KDMs currently installed.  
                         • Get Logs: Provide log reports from the Security Manager.  
                         • Get Log Info: Provide logging device information, such as event class, type, and sub-type.  
                         • Get Log Sig: Retrieve the log report signature.  
                         • Install Status: Query the installation status.  
                         • Play Control: Setup the Security Manager to playback a reel.  
                         • SM Status: Provide the Security Manager status.  
                         • SM Projector Tamper Control: Manage the tamper control |
### Role Authorized Services

<table>
<thead>
<tr>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>

- mechanism of the projector.
- * SM Heartbeat: Verify the Security Manager is still active.
- * SM Sys Log: Set syslog IP address.
- * SM Playerd Log: Request Security Manager to log playback.
- * IMB GPIO Output: Trigger hardware GPIO output.
- * ReloadConfig: Reload player configuration.

### Unauthenticated Services:

The cryptographic module supports the following unauthenticated services:

- * Show Status: Provides the current status of the module through LEDs.
- * Network Configuration: Non-security relevant configuration of the module.
- * Self-tests: Invoke the power-on self-tests by power cycling the module.

### Definition of Critical Security Parameters (CSPs)

The module contains the following CSPs:

- **Media Block Private Key (RSA 2048-bit)** – Used to decrypt KDMs and sign security logs
- **IMB TLS Private Key (RSA 2048-bit)** – Used to facilitate an internal TLS session
- **Protection AES Key (AES 128-bit)** – Used to encrypt the Media Block Private Key and Content Encryption Keys for persistent storage
- **Content Encryption Key (AES 128-bit)** – Used to decrypt content data
- **Content Integrity Key (HMAC-SHA-1 128-bit)** – Used to verify integrity of content data
- **TLS Encryption Keys (AES 128-bit)** – Provides data protection over TLS session
- **TLS Integrity Keys (HMAC-SHA-1 160-bit)** – Provides data integrity over TLS session

Copyright 2016, GDC Technology (USA), LLC. May be reproduced only in its original entirety [without revision].
• DRBG Key – Part of the state of the DRBG
• DRBG V – Part of the state of the DRBG

Definition of Public Keys:

The following are the public keys contained in the module:

• Media Block Public Key (RSA 2048-bit) – Used by external entities as the counterpart to the Media Block Public Key entities
• IMB TLS Public Key (RSA 2048-bit) – Used to facilitate an internal TLS session
• SM TLS Public Key (RSA 2048-bit) – Used to establish TLS connections
• SMS Root CA Certificate (RSA 2048-bit) – Used to verify the validity of SMS public keys received during a TLS session
• GDC FW Public Key (RSA 2048-bit) – Used to verify firmware updates
• Content Provider Public Keys (RSA 2048-bit) – Used to verify digital signatures on KDMs and CPLs
• Projector Public Keys (RSA 2048-bit) – Used during the DCI marriage process
• SMS Public Keys (RSA 2048-bit) – Used to verify authorized SMS during TLS sessions

Definition of CSPs Modes of Access

Table 5 defines the relationship between access to CSPs and the different module services. The modes of access shown in the table are defined as follows:

• Read
• Write

Please note that all authenticated services are sent through an encrypted TLS tunnel and as such, TLS related CSPs are utilized during each service.

| X | SM Heartbeat                                                                  | N/A                           |
| X | Get Build Info                                                                | N/A                           |
| X | SM Sys Log                                                                    | N/A                           |
| X | SM Playerd                                                                    | N/A                           |
7. Operational Environment

The FIPS 140-2 Area 6 Operational Environment requirements are not applicable; the cryptographic module supports a limited operational environment that restricts the loading of firmware by ensuring all firmware being installed is appropriately signed.
8. Security Rules

The cryptographic module’s design corresponds to the cryptographic module’s security rules. This section documents the security rules enforced by the cryptographic module:

1. The module provides identity-based authentication.
2. The module will only provide access to cryptographic services if a valid role has been assumed.
3. The cryptographic module shall perform the following tests:
   A. Power up Self-Tests:
      1. Cryptographic algorithm tests:
         a. AES Encrypt/Decrypt Known Answer Tests (KAT)
         b. HMAC-SHA-1 KAT
         c. SHA-1 KAT (tested as part of the HMAC-SHA-1 KAT)
         d. HMAC-SHA-1, -224, -256, -384, -512 KATs
         e. SHA-1 KAT
         f. SHA-224, -256, -384, -512 (tested as part of the HMAC SHA-224, -256, -384, -512 KATs)
         g. RSA Sign/Verify KAT
         h. SP800-90A DRBG KAT
      2. Firmware Integrity Tests (32-bit CRC)
      3. Critical Functions Tests: N/A

   B. Conditional Self-Tests:
      1. Continuous RNG test – performed on NDRNG and DRBG
      2. Firmware Load Test (RSA 2048-bit Signature Verification)
      3. SP800-90 Health Tests
      4. Data output shall be inhibited during self-tests and error states. In an error state, the module will restart and re-attempt self-tests.
      5. Status information shall not contain CSPs or sensitive data that if misused could lead to a compromise of the module.
9. Physical Security Policy

Physical Security Mechanisms

The Standalone IMB is a multi-chip embedded cryptographic module, which includes the following physical security mechanisms:

- Production-grade components.
- Hard, opaque, removable enclosure with tamper detection and response.
- Tamper evidence is provided by four (4) tamper seals that are applied during manufacturing. Figure 3 provides the correct locations of the tamper seals.

![Figure 3 - Tamper Seal Placement](image)

Operator Required Actions

The operator is required to periodically inspect the module for evidence of tampering. If the tamper seals have been broken, please contact your organization’s Security Administrator and the GDC Technology (USA), LLC.
