Overview

The Cisco Catalyst 6506, 6506-E, 6509 and 6509-E Switches together with the Wireless Services Module (WiSM) provides unparalleled security, mobility, redundancy, and ease of use for mission-critical wireless LANs (WLANs). The WiSM works in conjunction with Cisco Aironet® Series lightweight access points operating in LWAPP mode to deliver a secure and unified wireless solution that supports data, voice, and video applications.

The Cisco Catalyst 6506, 6506-E, 6509 and 6509-E Switches are multi-chip, standalone cryptographic modules containing a WiSM Module to perform the cryptographic operations and a supervisor engine to manage overall chassis configuration. The module meets all Level 2 FIPS 140-2 requirements.

The WiSM module in conjunction with Cisco Aironet Series Access Points support Wi-Fi Protected Access 2 (WPA2) security. WPA2 is the approved Wi-Fi Alliance interoperable implementation of the IEEE 802.11i standard. The WiSM module automatically detects, authorizes and configures access points, setting them up to comply with the centralized security policies of the wireless LAN. In a wireless network operating in this mode, WPA2 protects all wireless communications between the wireless client and other trusted networked devices on the wired network with AES-CCM encryption. LWAPP protects all control and bridging traffic between trusted network access points and the module with AES-CCM encryption. In the FIPS mode of operation, the WiSM supports WPA2 (802.11i), HTTPS using TLS, LWAPP, MFP, RADIUS KeyWrap (using AES Key wrapping), Local-EAP, TACACS+ and SNMP, and uses the following cryptographic algorithm implementations:

- AES (AES Cert. #555, vendor affirmed; key wrapping; key establishment methodology provides 128 bits of encryption strength)
- AES-CBC (software)
- AES-CCM (software)
- SHA-1 (software)
- HMAC SHA-1 (software)
- FIPS 186-2 Random Number Generator (software)
- RSA signature verification (software)
- RSA (key wrapping; key establishment methodology provides 96 bits of encryption strength)
- Diffie Hellman key establishment (software, key establishment methodology provides 112 bits of encryption strength)

HTTPS using TLS uses 1536 bit modulus RSA keys to wrap 128 bit AES symmetric keys, and RADIUS KeyWrap uses 128 bit AES keys as key encrypting keys.

This document details the security policy for the Cisco Catalyst 6506, 6506-E, 6509 and 6509-E Switches with Wireless Services Module (WiSM). This security policy may be freely distributed.

The evaluated platform consists of the following:

- Chassis Hardware Version
  - Catalyst 6506 switch
  - Catalyst 6506-E switch
  - Catalyst 6509 switch
  - Catalyst 6509-E switch
- Backplane Hardware Version
  - 1.0, 1.1, 1.2 (Catalyst 6506-E switch)
Overview

- Supervisor Blade Hardware Version
  - SUP720-3B versions 4.0, 4.1, 4.2, 4.3, 4.4, 4.5, 4.6, 5.1, 5.2, 5.3, 5.4, 5.5, 5.6, 5.7, 5.8, 5.9
  - SUP720-3BXL version 4.0, 4.5, 4.6, 5.1, 5.2, 5.3, 5.4, 5.5, 5.6, 5.7, 5.8, 5.9
- WiSM Module Firmware Versions 1.0, 1.1, 1.2, 1.3, 1.4, 2.0, 2.1, 2.2, 2.3
- WiSM Module Firmware Versions 4.1.171.0 and 4.1.185.10

This security policy describes how the listed Cisco Catalyst 6506, 6506-E, 6509 and 6509-E Switches with the WiSM Module meet the security requirements of FIPS 140-2, and describes how to operate the hardware devices in a secure FIPS 140-2 mode. This policy was prepared as part of the Level 2 FIPS 140-2 validation of the listed Cisco Catalyst 6506, 6506-E, 6509 and 6509-E Switches with the Wireless Services Module (WiSM). This Security Policy document is non-proprietary and can be freely distributed.

FIPS 140-2 (Federal Information Processing Standards Publication 140-2-Security Requirements for Cryptographic Modules) details the U.S. Government requirements for cryptographic modules. More information about the FIPS 140-2 standard and validation program is available on the NIST website at this URL:

http://csrc.nist.gov/cryptval/

Cisco Catalyst 6506, 6506-E, 6509, and 6509-E Switches with WiSM Cryptographic Modules

The cryptographic boundary is defined as encompassing the following:

- Top, front, left, right, and bottom surfaces of the chassis.
- All portions of the backplane of the chassis that are not designed to accommodate a network module or a service module.
- The inverse of the three-dimensional space within the chassis that would be occupied by any installed network module or a service module which does not perform approved cryptographic functions, or any installed power supply.
- The connection apparatus between the network module (or service module) and the motherboard/daughterboard that hosts the network module (or service module).

Figure 1 and Figure 2 below show the cryptographic boundary as the dark border around the module.

The cryptographic boundary does not include the network module or service module itself unless it performs approved cryptographic functions. In other words, the cryptographic boundary encompasses all hardware components within the chassis except any installed non-approved cryptographic network modules or service modules and the power supply sub-modules. The service and network modules currently included in the cryptographic boundary are one WiSM module and one supervisor board (either a SUP720-3B or a SUP720-3BXL).

The service modules require that a special opacity shield be installed over the intake-side air vents to operate in FIPS-approved mode. The shield decreases the surface area of the vent holes, reducing visibility within the cryptographic boundary to FIPS-approved specifications. Detailed installation instructions for the shield are provided in this publication.
Figure 1  Cryptographic Boundary on Catalyst 6506 and Catalyst 6506E Switches

[Diagram of Catalyst 6506 and Catalyst 6506E Switches with labels for Supervisor engine, Wireless Service module, and Fan tray]
Secure Configuration

The initial configuration of the Supervisor card is accomplished by creating a VLAN that defines the connection between the Supervisor card and the WiSM card and by creating authentication data as explained in the Configure Supervisor Authentication Data section.

The initial configuration of the WiSM is performed through the local access of CLI of the Supervisor and by initiating a session from the supervisor CLI to each of the controller in the WiSM. The rest of the configuration shall be performed over a local link through the console connection of each of the controller in the WiSM. After the first three steps below, remote access through HTTPS may be used for subsequent configuration. For connecting using HTTPS, the Crypto Officer shall configure their web browsers so that only TLS v1.0 is used. The HTTPS client must be configured to use AES_128_CBC_SHA based cipher suites.

Only the 4.1.171.0 or 4.1.185.10 LWAPP software releases may be contained on the wireless LAN controllers for distribution to access points.
Secure Configuration

Configure Supervisor Authentication Data

The Supervisor crypto officer (this role is defined in the Roles, Services and Authentication section) must create the enable password for the supervisor crypto officer role. The password must be at least eight characters (all digits, all lower and uppercase letters, and all special characters except '?' are accepted) and is entered when the crypto officer first engages the enable command. The crypto officer enters the following syntax at the # prompt:

```plaintext
# enable secret password
```

The crypto officer must always assign passwords (of at least eight characters) to users. Enter this command to set user passwords:

```plaintext
# username name password password
```

Follow these steps on each WiSM controller to securely configure the module:

1. Enable FIPS Mode of Operations
2. Disable Boot Break
3. Configure HTTPS Key
4. Configure WiSM Authentication Data
5. Configure RADIUS KeyWrap KEK and MACK Keys
6. Configure Ciphersuites for 802.11i
7. Configure Pre-shared Keys for 802.11i
8. Configure SNMP
9. Configure TACACS+ secret
10. Configure MFP (Management Frame Protection)
11. Configure Local EAP
12. Configure EAP-FAST
13. Save and Reboot

Enable FIPS Mode of Operations

The following CLI command places the controller in the WiSM in FIPS mode of operations, enabling all necessary self tests and algorithm restrictions:

```plaintext
> config switchconfig fips-prerequisite enable
```

Disable Boot Break

The following CLI command prevents breaking out of the boot process. It must be executed after enabling FIPS mode of operations.

```plaintext
> config switchconfig boot-break disable
```
Secure Configuration

Configure HTTPS Key

The following command configures the controller to use device keys for the HTTPS server. It must be executed after enabling FIPS mode of operations:

> config certificate use-device-certificate webadmin

Configure WiSM Authentication Data

All users shall have a password containing 8 or more characters, including numbers and letters. A crypto officer can use the following CLI command to set user passwords:

> config mgmtuser password username password

Note that this and all subsequent configuration steps may also be performed through HTTPS. However, only the CLI commands are included in this document.

Configure RADIUS KeyWrap KEK and MACK Keys

The following CLI commands configure the RADIUS secret and AES-key wrap KEK and MACK:

> config radius auth add wlan-index ip-address port hex secret
> config radius auth keywrap add hex kek mack radius-index
> config radius auth keywrap enable

Configure Ciphersuites for 802.11i

The following CLI commands create a wireless LAN, configure it to use WPA2, associate it with a RADIUS server, and enable it:

> config wlan create index profile_name ssid
> config wlan radius_server auth add index radius-server-index
> config wlan enable index

Configure Pre-shared Keys for 802.11i

WPA2 Pre-shared key (WPA2-PSK) is an optional mode permitted by this security policy. Generation of pre-shared keys is outside the scope of this security policy, but you should entered them as 64 hexadecimal values (256 bits) using the following command syntax:

> config wlan security wpa akm psk set-key hex key index
> config wlan security wpa akm psk enable index

Configure SNMP

Non-security related remote monitoring and management of the Controllers can be done via SNMP. Only SNMPv3 with HMAC-SHA-1 is permitted by this security policy. The user passwords shall be selected to be 8 or more characters, including numbers and letters.
The following CLI commands enable SNMPv3 with HMAC-SHA1:

```
> config snmp version v1 disable
> config snmp version v2c disable
> config snmp version v3 enable
> config snmp v3user create username [ro|rw] hmacsha [none|des] authkey encryptkey
```

**Configure TACACS+ secret**

The crypto officer may configure the module to use TACACS+ for authentication, authorization and accounting. Configuring the module to use TACACS+ is optional. If the module is configured to use TACACS+, the Crypto-Officer must define TACACS+ shared secret keys that are at least 8 characters long. The following CLI command configures TACACS+ for authentication (auth), authorization (athr) and accounting (acct):

```
> config tacacs [auth | athr | acct] add index ip port [ascii | hex] secret
```

Refer to the Cisco Wireless LAN Controller Configuration Guide for additional instructions.

**Configure MFP (Management Frame Protection)**

Infrastructure MFP enables one access point to validate a neighboring access point’s management frames. Configuring the module to use MFP is optional. The following CLI command is used to enable infrastructure MFP:

```
> config wps mfp infrastructure enable
```

Client MFP is used to encrypt and sign management frames between the AP and the client. The following CLI command is used to enable client MFP:

```
> config wlan mfp client enable index required
```

Refer to the Cisco Wireless LAN Controller Configuration Guide for additional instructions.

**Configure Local EAP**

The module can be optionally configured as a local EAP authentication server to authenticate wireless clients. Both EAP-TLS and EAP-FAST are supported and permitted by this security policy.

Refer to the Cisco Wireless LAN Controller Configuration Guide for instructions on configuring the Local EAP server to authenticate wireless clients without a RADIUS server.

**Configure EAP-FAST**

EAP-FAST is an Extensible Authentication protocol and can be used as an authentication method between the Controller and the wireless client. When a RADIUS server is used to authenticate clients, no extra EAP-FAST configuration is required.

The following CLI command is used by the crypto officer to enter a new EAP-FAST server key, where hex-key can be up to 32 hex digits or 16 bytes.

```
> config local-auth method fast server-key hex-key
```
Roles, Services, and Authentication

Refer to the Cisco Wireless LAN Controller Configuration Guide for instructions on configuring Local EAP server with EAP-FAST as the authentication method for the wireless clients.

Save and Reboot

After executing the above commands, you must save the configuration and reboot the system:

```
> save config
> reset system
```

Roles, Services, and Authentication

This section describes the roles, services, and authentication types in the security policy.

Roles

The module supports these six roles:

- **AP Role**—This role is filled by an access point associated with the controller in the WiSM.
- **Client Role**—This role is filled by a wireless client associated with the controller in the WiSM.
- **User Role**—This role performs general security services including cryptographic operations and other approved security functions. The product documentation refers to this role as a management user with read-only privileges.
- **Crypto Officer (CO) Role**—This role performs the cryptographic initialization and management operations. In particular, it perform the loading of optional certificates and key-pairs and the zeroization of the module. The product documentation refers to this role as a management user with read-write privileges.
- **Supervisor Crypto Officer (CO) Role**—This role performs the initial WiSM configuration by initiating a session to the WiSM through the local access of the switch (Supervisor) CLI. The Supervisor CO can zeroize the user passwords stored in the Supervisor Engine.
- **Supervisor User Role**—This role can perform basic supervisor user services and can view the status of the WiSM configuration from the Supervisor CLI by issuing the show commands.

The module does not support a maintenance role.
Services

All services can be viewed by typing ? from within the appropriate roles. This command shows all the services available to the role currently logged in. The services provided are summarized in Table 1.

<table>
<thead>
<tr>
<th>Service</th>

</tr>
<tr>
<td>AP Association</td>
<td>AP</td>
<td>Association of the AP with the WiSM.</td>
</tr>
</tbody>
</table>

The module does not support a bypass capability in the approved mode of operations.

1. LWAPP uses RSA key wrapping which provides 96 bits of effective symmetric key strength.
Ports and Interfaces

The Cisco Catalyst series switch module has the following physical ports and interfaces:

- 1 console port on the Supervisor front panel
- 2 console ports on the WiSM front panel
- 2 Gigabit Ethernet ports on the Supervisor front panel
- 1 10/100/1000 Ethernet port on the Supervisor front panel
- Power, status LEDs on the WiSM and Disk, Link and Status LEDs on the Supervisor

Supervisor User and Supervisor CO Authentication

When a Supervisor User tries to connect to the CLI of the Supervisor via the Console port, the module prompts the Supervisor User to enter a password. The Supervisor User is authenticated based on the password provided. Once the user has been authenticated, the module provides a basic set of services to that user.

The Supervisor Crypto Officer must first assume the Supervisor User role and then enter the “enable” command. The Supervisor CO will be prompted to enter another password in order to receive additional services that are reserved for the Supervisor Crypto Officer. The Supervisor CO will be authenticated if a correct password is provided to the module.

User and CO Authentication

When a user first connects to the controllers in the WiSM module through the console ports, the module prompts the user to enter a username and password. The user is authenticated based on the password provided. Once the user has been authenticated, the module provides services based on whether they have read-only privileges (the User role) or read-write privileges (the CO role).

The "*" characters are used to mask the password when the users authenticate. If the incorrect password is entered, the module will re-prompt the user to login.

After the module power cycles, a user must reauthenticate.

The module supports password based local authentication for access via the CLI or HTTPS, as well as remote authentication using RADIUS and TACACS+. The module also supports non-crypto related remote access via the SNMPv3. RADIUS, TACACS+ and SNMPv3 may be used in the FIPS mode.

The security policy stipulates that all user passwords must be 8 alphanumeric characters, so the password space is 2.8 trillion possible passwords (for a character set of 36). The possibility of randomly guessing a password is thus far less than one in one million. To exceed a one in 100,000 probability of a successful random password guess in one minute, an attacker would have to be capable of 28 million password attempts per minute, which far exceeds the operational capabilities of the module to support.

AP Authentication

Each controller of the WiSM module in the Cisco Catalyst series switch performs mutual authentication with an access point through the LWAPP protocol, using an RSA key pair with 1536 bit modulus, which has an equivalent symmetric key strength of 96 bits. An attacker would have a 1 in $2^{96}$ chance of randomly obtaining the key, which is much stronger than the one in a million chance required by FIPS.
140-2. To exceed a one in 100,000 probability of a successful random key guess in one minute, an attacker would have to be capable of approximately $7.9 \times 10^{23}$ attempts per minute, which far exceeds the operational capabilities of the module to support.

### Client Authentication

Each controller of the WiSM module in the Cisco Catalyst series switch performs mutual authentication with a wireless client through EAP-TLS or EAP-FAST protocols. EAP-FAST is based on EAP-TLS and uses EAP-TLS key pair and certificates. The RSA key pair for the EAP-TLS credentials has modulus size of 1024 bit to 2048 bit, thus providing between 80 bits and 112 bits of strength. Assuming the low end of that range, an attacker would have a 1 in 280 chance of randomly obtaining the key, which is much stronger than the one in a million chance required by FIPS 140-2. To exceed a one in 100,000 probability of a successful random key guess in one minute, an attacker would have to be capable of approximately $1.8 \times 10^{21}$ attempts per minute, which far exceeds the operational capabilities of the modules to support.

### Cryptographic Key Management

Cryptographic keys are stored in plaintext form in flash for long term storage and in SDRAM (for active keys) of the controllers in the WiSM module. The AES key wrap KEK, AES key wrap MAC keys and the Pre shared key (PSK) are input by the CO in plaintext over a local console connection or in encrypted form when sent over the TLS session. The PMK and NSK are input from the RADIUS server encrypted with the AES key wrap protocol. RSA public keys are output in plaintext in the form of X.509 certificates.

The LWAPP session key is output wrapped with the AP's RSA key, and the MFP MIC key, 802.11i PTK, and 802.11i GTK are output encrypted with the LWAPP session key. PAC key is output wrapped with the Client's RSA key. Asymmetric key establishment (RSA key transport) is used in the creation of session keys during EAP-TLS and EAP-FAST. Any keys not explicitly mentioned are not input or output.

Table 2 lists the secret and private cryptographic keys and CSPs used by the module. Table 3 lists the public keys used by the module. Table 4 lists the access to the keys by service.

The module uses RSA key wrapping with 1536 bit modulus and provides 96 bits of encryption strength in key establishment.

## Cryptographic Key Management

### Table 4  
**Key/CSP Access by Service**

<table>
<thead>
<tr>
<th>Service</th>
<th>Key Access</th>
</tr>
</thead>
</table>
| Local EAP Authenticator (EAP-FAST) | In-band PAC Provisioning without certificates:  
- Establish EAP-TLS pre-master secret using anonymous Diffie Hellman key exchange  
- Derive EAP-TLS master secret and EAP-TLS tunnel encryption and integrity keys  
- Read EAP-FAST Server Key and generate EAP-FAST PAC-Key for the client  
In-band PAC Provisioning with certificates:  
- Sign with VendorDeviceCert Private Key  
- Read (and transmit) VendorCACert  
- Read and verify Client certificate  
- Establish EAP-TLS pre-master secret using authenticated Diffie Hellman key exchange  
- Derive EAP-TLS master secret and EAP-TLS tunnel encryption and integrity keys  
- Read EAP-FAST Server Key and generate EAP-FAST PAC-Key for the client  
EAP-FAST Tunnel Establishment:  
- Read EAP-FAST Server Key  
- Decrypt client PAC to recover client EAP-FAST PAC-Key  
- Derive EAP-FAST Master secret and tunnel encryption/integrity keys and EAP-FAST Session-Key Seed.  
Authentication:  
- Derive EAP-FAST Inner Method Session Key according to the inner EAP algorithm  
- Derive EAP-FAST Master Session Key using the Session-Key Seed and Inner Method Session Key(s) |
| 802.11i |  
- Compute 802.11i KCK, 802.11i KEK and 802.11i PTK from 802.11i PMK or 802.11i PSK  
- Generate 802.11i GTK  
- Encrypt/decrypt using 802.11i KEK  
- Authenticate data using 802.11i KCK |
| RADIUS |  
- Decrypt 802.11i PMK using KeyWrap KEK  
- Authenticate data using KeyWrap MACK |
Key Zeroization

All keys in the WiSM controllers can be zeroized by entering this CLI command:

```
> config switchconfig key-zeroize controller
```

After you enter the command, power cycle the module and hold down the Esc key to initiate a memory test that clears residual keys from the RAM.

Disallowed Security Functions

These cryptographic algorithms are not approved and may not be used in FIPS mode of operations:

- RC4
- MD5
- HMAC MD5
- Triple-DES
- AES-CTR
- CCKM

Self Tests

The following self tests are performed by the module:

- Firmware integrity test on the IOS and LWAPP firmware.
- Power on self test of AES-CBC AES-CCM, SHA-1, HMAC SHA-1, RNG and RSA algorithms.
- Continuous random number generator test for Approved and non-Approved RNGs.

Installing the Opacity Shield on Catalyst 6506, 6506-E, 6509 and 6509-E Switches

The Catalyst 6500 series opacity shield is designed to be installed while the system is operating without creating an electrical hazard or damage to the system. You will need some clearance between adjacent racks in order to perform this procedure. This procedure is applicable to the following Catalyst 6500 series switches:

- Catalyst 6506 switch
- Catalyst 6506-E switch
- Catalyst 6509 switch
- Catalyst 6509-E switch
Follow these steps to install an opacity shield on the Catalyst 6506, 6506-E, 6509 and 6509-E Switches:

### Step 1
The opacity shield is designed to be installed on a Cisco Catalyst 6506, 6506-E, 6509 and 6509-E Switch chassis that is already rack-mounted. If your Catalyst 6500 series switch chassis is not rack-mounted, install the chassis in the rack using the procedures contained in the Catalyst 6500 Series Switches Installation Guide. If your Catalyst 6500 series switch chassis is already rack-mounted, proceed to Step 2.

### Step 2
Open the FIPS kit packaging. The kit contains the following items:
- A packaged opacity shield assembly with installation hardware for the Catalyst 6506 and Catalyst 6506-E switch chassis (part number 800-27009).
- A packaged opacity shield assembly with installation hardware for the Catalyst 6509 and Catalyst 6509-E switch chassis (part number 800-26335).
- An envelope with 60 FIPS tamper-evidence labels.
- An envelope containing a disposable ESD wrist strap.

### Step 3
Select the appropriate opacity shield kit for your system and set the other opacity shield kit aside.

### Step 4
Open the protective packaging and remove the opacity shield and the two bags of installation hardware. The bag with the part number 69-1482 contains the installation hardware for non-E chassis; the other bag (part number 69-1497) contains the installation hardware for -E chassis. Select the bag of installation hardware appropriate for your installation. Set the second bag of fasteners aside; you will not need them for this installation.

### Step 5
Open the bag of installation hardware and remove the following items:
- (Bag with part number 69-1482)—Two M3 thumbscrews, four M3 snap rivet fasteners. The snap rivet fasteners come assembled; you need to separate the two pieces of the snap rivet fastener by removing the snap rivet pin from the snap rivet sleeve before you install them in the opacity shield.
- (Bag with part number 69-1497)—Two M4 thumbscrews, four M4 snap rivet fastener sleeves, and four M4 snap rivet pins.

### Step 6
Start the two thumbscrews in the corresponding threaded holes in the opacity shield; two or three turns is sufficient. Do not thread the screws too far into the opacity shield. The opacity shield for the Catalyst 6509 or Catalyst 6509-E chassis is identified by a 6509-E that is silk-screened adjacent to several of the threaded holes; the opacity shield for the Catalyst 6506 or Catalyst 6506-E chassis is identified by a 6506-E that is silk-screened adjacent to several of the threaded holes.

Figure 3 shows how opacity shield is positioned on the 6506 or 6506-E switch. Figure x shows how opacity shield is positioned on the 6509 or 6509-E switch.

### Step 7
Open the envelope containing the disposable ESD wrist strap. Attach the disposable ESD wrist strap to your wrist. Attach the other end of the wrist strap to exposed metal on the chassis.

### Step 8
Position the opacity shield over the air intake side of the chassis so that the two thumbscrews on the opacity shield are aligned with the unused L-bracket screw holes on the chassis.

### Step 9
Press the opacity shield firmly against the air intake side of the chassis and hand tighten the two thumbscrews to secure the opacity shield to the chassis.

### Step 10
Position the rivet sleeve over either one of the square cutouts on the opacity shield (non-E chassis) or over the one of the round cutouts on the opacity shield (-E chassis). Press the rivet sleeve through the cutout, through the opacity shield material, and through one of the chassis air vent perforations.

### Step 11
Take the rivet pin and push it through the rivet sleeve until you hear a click.
Step 12  Repeat step 10 and step 11 for the remaining three snap rivet fasteners.

Figure 3  Installing the Opacity Shield on the Catalyst 6506 or Catalyst 6506E Switch
Physical Security

The Cisco Catalyst 6506, 6506-E, 6509 and 6509-E Switches are entirely encased by a thick steel chassis. Nine module slots are provided on the Catalyst 6509 switch and Catalyst 6509-E switch and six module slots are provided on the Catalyst 6506 switch and Catalyst 6506-E switch. On-board LAN connectors and console connectors are provided on the supervisor engines, and console connectors are provided on the WiSM. The power cable connection and a power switch are provided on the power supply of all the models. The individual modules that comprise the switch may be removed to allow access to the internal components of each module.
Physical Security

Any chassis slot that is not populated with a module must have a slot cover installed in order to operate in a FIPS-compliant mode. The slot covers are included with each chassis, and additional slot covers may be ordered from Cisco. Use the procedure described here to apply tamper-evidence labels to the network modules and the service modules.

After the switch has been configured to meet FIPS 140-2 Level 2 requirements, the switch cannot be accessed without indicating signs of tampering. To seal the system with tamper-evidence labels, follow these steps:

Step 1  Remove any grease, dirt, or oil from the cover by using alcohol-based cleaning pads before applying the tamper-evidence labels. The chassis temperature should be above 10° C (50° F).

Step 2  Place labels on the chassis as shown in Figure 5 and Figure 6.

   a. Fan tray—The tamper-evidence label should be placed so that one half of the label adheres to the front of the fan tray and the other half adheres to the left side of the chassis. Any attempt to remove the fan tray will damage the tamper seal, which indicates tampering has occurred.

   b. Modules—For each Supervisor Engine 720, WiSM Module or blank module cover installed in the chassis, place a tamper-evidence label so that one half of the label adheres to the right side of the module and the other half adheres to the right side of the chassis. Any attempt to remove the fan tray will damage the tamper seal, which indicates tampering has occurred.

   c. Power supply—For each power supply or power supply blank cover installed in the chassis, place a tamper-evidence label so that one half of the label adheres to the front of the power supply or power supply blank cover and the other half adheres to the chassis. Any attempt to remove the fan tray will damage the tamper seal, which indicates tampering has occurred.

   d. Opacity shield—Four labels should be applied to the opacity shield (mounted on the right side of the chassis) as follows:
      - Place one label so that one half of the label adheres to the top of the opacity shield and the other half adheres to the chassis.
      - Place one label so that one half of the label adheres to the left side of the opacity shield and the other half adheres to the chassis.
      - Place one label so that one half of the label adheres to the right side of the opacity shield and the other half adheres to the chassis.
      - For the Catalyst 6509 switch chassis only, place one label so that one half of the label adheres to the bottom of the opacity shield and the other half adheres to the right side of the chassis.

Step 3  Place labels on each supervisor engine installed in the chassis as shown in the figures below.

   a. Place a tamper-evidence label so that one half of the label adheres to the PCMCIA slot and the other half adheres to the Supervisor Engine faceplate. Any attempt to install or remove a Flash PC card will damage the tamper seal, which indicates tampering has occurred.

   b. Place a tamper-evidence label so that one half of the label adheres to the GBIC transceiver installed in the supervisor engine network interface uplink port and the other half adheres to the Supervisor Engine 2 faceplate. Any attempt to remove a GBIC transceiver will damage the tamper seal, which indicates tampering has occurred.

   c. Place a tamper-evidence label so that it completely covers an unpopulated network interface uplink port. Any attempt to install a GBIC transceiver in the network interface uplink port will damage the tamper seal, which indicates tampering has occurred.
**Step 4** Place labels on each WiSM installed in the chassis as shown in the figures below.

   a. Place tamper-evidence labels on both the PCMCIA slots such that one half of the label adheres to the PCMCIA slots and the other half adheres to the WiSM faceplate. Any attempt to install or remove the Compact Flash cards will damage the tamper seals, which indicates tampering has occurred.

---

**Note**

The tamper seal label adhesive completely cures within five minutes.

---

**Figure 5** *Catalyst 6506 and Catalyst 6506E Switch Chassis Tamper-Evidence Label Placement*

![Catalyst 6506 and Catalyst 6506E Switch Chassis Tamper-Evidence Label Placement](image1)

**Figure 6** *Catalyst 6509 and Catalyst 6509E Switch Chassis Tamper-Evidence Label Placement*

![Catalyst 6509 and Catalyst 6509E Switch Chassis Tamper-Evidence Label Placement](image2)
The tamper-evidence seals are made from a special thin-gauge vinyl with self-adhesive backing. Any attempt to open the chassis, remove the modules or power supplies, or remove the opacity shield will damage the tamper-evidence seals or the painted surface and metal of the chassis. The tamper-evidence seals must be inspected for damage to verify that the module has not been tampered with.

Tamper-evidence seals can also be inspected for signs of tampering, which include the following: curled corners, bubbling, crinkling, rips, tears, and slices. The word OPEN may appear if the label was peeled back.

Mitigation of Attacks

The Controllers in the WiSM module provide mitigation against the following attacks:

- Protection against wireless denial of service attacks due to forged 802.11 management frames. When wireless clients and wireless infrastructure are enabled with MFP (Management Frame Protection) the system is protected against DoS attacks from exploited 802.11 management frames.
- Protection against rogue or unauthorized access points in joining the trusted network. The Cisco access points and Controllers support mutual authentication via x.509 certificates that are installed from the factory.
- Protection against MiTM attacks against access point control traffic. All control and bridging traffic between Controllers and access points is protected with AES-CCM encryption.

Obtaining Documentation, Obtaining Support, and Security Guidelines

For information on obtaining documentation, obtaining support, providing documentation feedback, security guidelines, and also recommended aliases and general Cisco documents, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:
