Health IT at NIST

NIST research and development in standards, testing, security and privacy, usability, certification, and emerging technologies will enable health IT interoperability and adoption.

Overview
NIST’s mission is to promote U.S. innovation and industrial competitiveness by advancing measurement science, standards, and technology in ways that enhance economic security and improve our quality of life. NIST’s Information Technology Laboratory accelerates the development and deployment of information and communication systems that are reliable, usable, interoperable, and secure; advances measurement science through innovations in mathematics, statistics, and computer science; and conducts research to develop the measurements and standards infrastructure for emerging information technologies and applications.

Industry Need Addressed
As health IT has become a top priority around the nation, it is clear that standards and interoperability are key to the fulfillment of the goals of health IT:

• Higher quality and more efficient care.
• Seamless, secure, and private movement of data between healthcare providers and consumers without compromise or loss of information.
• Access to medical histories (including diagnoses, diagnostic tests, laboratory tests, and medication lists) at the point of care and in other settings.
• Fewer errors and redundant tests.
• More efficient and effective reporting, including surveillance and quality monitoring.
• Quick detection of adverse drug reactions and epidemics.

NIST Approach
NIST has been collaborating with industry and others to improve the healthcare information infrastructure since the 1990s. NIST IT researchers have an internationally respected reputation for their knowledge, experience, and leadership. Since 2004, NIST has worked closely with the Department of Health and Human Services’ Office of the National Coordinator for Health IT (HHS/ONC). The role of NIST is further articulated in the 2008-2012 Federal Health IT strategic plan and the Health Information Technology for Economic and Clinical Health (HITECH) Act to:

• Advance healthcare information enterprise integration through standards and testing.
• Consult on updating the Federal Health IT Strategic Plan.
• Consult on voluntary certification programs.
• Consult on health IT implementation.
• Provide pilot testing of standards and implementation specifications, as requested.

Impact
The NIST Health IT program will help improve the quality and availability of healthcare and reduce healthcare costs by enabling the establishment of an emerging health IT network that is correct, complete, secure, usable, and testable.
