

## Preparing for Intrusion Detection Presentation Abstract

Systems and networks are subject to attacks both internally and externally. The increasingly frequent attacks on Internet-visible systems could be attempts to steal your company jewels, personal employee and customer information, or use of your computer resources. Intrusion detection systems collect information from a variety of vantage points within the operating systems and networks.

This session will examine intrusion-detection and vulnerability-assessment technologies that will allow your organization to protect the enterprise from losses associated with network security problems. We will review how intrusion detection and vulnerability assessment products fit into the overall security architecture; case histories; and product features.
