

**Single Sign-on: Myth or Reality
Presentation Abstract**

As enterprise computing becomes more and more complex, with business systems installed across multiple platforms, from mainframe to client-server to PC, the need for a secure way to provide users with a single authentication point becomes more and more important. There are a number of methods and products on the market today that provide some form of single sign-on, and each has advantages and risks.

This session will examine what you will need to do to be prepared for secure single sign-on. We will also identify a set of functional requirements for a secure single sign-on methodology, so that attendees will be better able to compare the products available.
