# Caveats and Disclaimers

- This presentation provides education on cloud technology and its benefits to set up a discussion of cloud security
- It is NOT intended to provide official NIST guidance and NIST does not make policy
- Any mention of a vendor or product is NOT an endorsement or recommendation

Citation Note: All sources for the material in this presentation are included within the Powerpoint “notes” field on each slide

# Agenda

- Part 1: Effective and Secure Use
  - Understanding Cloud Computing
  - Cloud Publications
  - Computing Cloud Computing Security
  - Cloud Migration Paths
- Part 2: Cloud Resources, Case Studies, and Security Models
  - Thoughts on Cloud Computing
  - Foundational Elements of Cloud Computing
  - Cloud Economics
  - Cloud Computing Case Studies and Security Models
  - Cloud Computing and Standards

# Part I: Effective and Secure Use

# Understanding Cloud Computing

# Origin of the term “Cloud Computing”

- “Comes from the early days of the Internet where we drew the network as a cloud... we didn’t care where the messages went... the cloud hid it from us” – Kevin Marks, Google
- First cloud around networking (TCP/IP abstraction)
- Second cloud around documents (WWW data abstraction)
- The emerging cloud abstracts infrastructure complexities of servers, applications, data, and heterogeneous platforms
  - (“muck” as Amazon’s CEO Jeff Bezos calls it)

# A Working Definition of Cloud Computing

- Cloud computing is a pay-per-use model for enabling available, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.
- This cloud model promotes availability and is comprised of five **key characteristics**, three **delivery models**, and four **deployment models**.

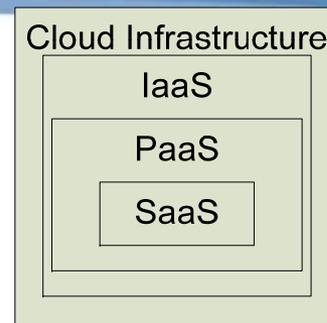

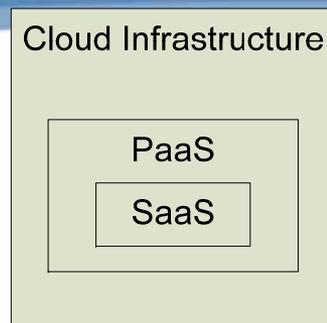

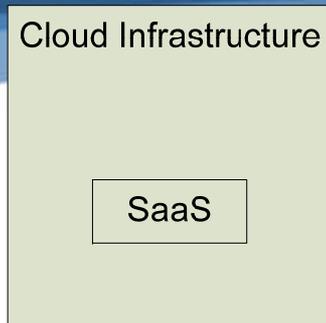

# 5 Key Cloud Characteristics

- On-demand self-service
- Ubiquitous network access
- Location independent resource pooling
- Rapid elasticity
- Pay per use

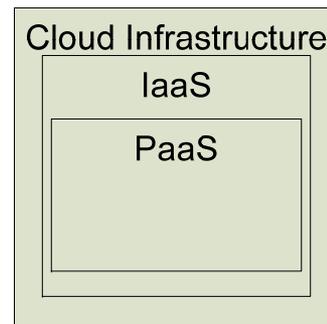

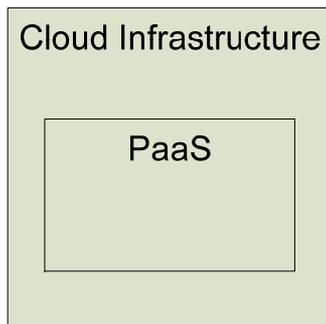

# 3 Cloud Delivery Models

- Cloud Software as a Service (SaaS)
  - Use provider's applications over a network
- Cloud Platform as a Service (PaaS)
  - Deploy customer-created applications to a cloud
- Cloud Infrastructure as a Service (IaaS)
  - Rent processing, storage, network capacity, and other fundamental computing resources
- To be considered “cloud” they must be deployed on top of cloud infrastructure that has the key characteristics

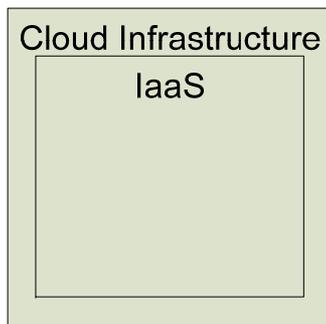

# Delivery Model Architectures

Software as a Service  
(SaaS)  
Architectures

Platform as a Service (PaaS)  
Architectures

Infrastructure as a Service (IaaS)  
Architectures

# 4 Cloud Deployment Models

- Private cloud
  - enterprise owned or leased
- Community cloud
  - shared infrastructure for specific community
- Public cloud
  - Sold to the public, mega-scale infrastructure
- Hybrid cloud
  - composition of two or more clouds
- Two types: internal and external

# Common Cloud Characteristics

- Cloud computing often leverages:
  - Massive scale
  - Virtualization
  - Free software
  - Autonomic computing
  - Multi-tenancy
  - Geographically distributed systems
  - Advanced security technologies
  - Service oriented software

# Cloud Computing Publications

# Planned NIST Cloud Computing Publication

- NIST is planning a series of publications on cloud computing
- NIST Special Publication to be created in FY09
  - What problems does cloud computing solve?
  - What are the technical characteristics of cloud computing?
  - How can we best leverage cloud computing and obtain security?

# Cloud Computing Security

# Analyzing Cloud Security

- Some key issues:
  - trust, multi-tenancy, encryption, compliance
- Clouds are massively **complex systems** can be reduced to **simple primitives** that are replicated thousands of times and **common functional units**
- Cloud security is a tractable problem
  - There are both advantages and challenges

Former Intel CEO, Andy Grove: “only the paranoid survive”

# General Security Advantages

- Shifting public data to a external cloud reduces the exposure of the internal sensitive data
- Cloud homogeneity makes security auditing/testing simpler
- Clouds enable automated security management
- Redundancy / Disaster Recovery

# General Security Challenges

- Trusting vendor's security model
- Customer inability to respond to audit findings
- Obtaining support for investigations
- Indirect administrator accountability
- Proprietary implementations can't be examined
- Loss of physical control

# Security Relevant Cloud Components

- Cloud Provisioning Services
- Cloud Data Storage Services
- Cloud Processing Infrastructure
- Cloud Support Services
- Cloud Network and Perimeter Security
  
- Elastic Elements: Storage, Processing, and Virtual Networks

# Provisioning Service

- Advantages
  - Rapid reconstitution of services
  - Enables availability
    - Provision in multiple data centers / multiple instances
  - Advanced honey net capabilities
- Challenges
  - Impact of compromising the provisioning service

# Data Storage Services

- Advantages
  - Data fragmentation and dispersal
  - Automated replication
  - Provision of data zones (e.g., by country)
  - Encryption at rest and in transit
  - Automated data retention
- Challenges
  - Isolation management / data multi-tenancy
  - Storage controller
    - Single point of failure / compromise?
  - Exposure of data to foreign governments

# Cloud Processing Infrastructure

- Advantages
  - Ability to secure masters and push out secure images
- Challenges
  - Application multi-tenancy
  - Reliance on hypervisors
  - Process isolation / Application sandboxes

# Cloud Support Services

- Advantages
  - On demand security controls (e.g., authentication, logging, firewalls...)
- Challenges
  - Additional risk when integrated with customer applications
  - Needs certification and accreditation as a separate application
  - Code updates

# Cloud Network and Perimeter Security

- Advantages
  - Distributed denial of service protection
  - VLAN capabilities
  - Perimeter security (IDS, firewall, authentication)
- Challenges
  - Virtual zoning with application mobility

# Cloud Security Advantages

## Part 1

- Data Fragmentation and Dispersal
- Dedicated Security Team
- Greater Investment in Security Infrastructure
- Fault Tolerance and Reliability
- Greater Resiliency
- Hypervisor Protection Against Network Attacks
- Possible Reduction of C&A Activities (Access to Pre-Accredited Clouds)

# Cloud Security Advantages

## Part 2

- Simplification of Compliance Analysis
- Data Held by Unbiased Party (cloud vendor assertion)
- Low-Cost Disaster Recovery and Data Storage Solutions
- On-Demand Security Controls
- Real-Time Detection of System Tampering
- Rapid Re-Constitution of Services
- Advanced Honeynet Capabilities

# Cloud Security Challenges

## Part 1

- Data dispersal and international privacy laws
  - EU Data Protection Directive and U.S. Safe Harbor program
  - Exposure of data to foreign government and data subpoenas
  - Data retention issues
- Need for isolation management
- Multi-tenancy
- Logging challenges
- Data ownership issues
- Quality of service guarantees

# Cloud Security Challenges

## Part 2

- Dependence on secure hypervisors
- Attraction to hackers (high value target)
- Security of virtual OSs in the cloud
- Possibility for massive outages
- Encryption needs for cloud computing
  - Encrypting access to the cloud resource control interface
  - Encrypting administrative access to OS instances
  - Encrypting access to applications
  - Encrypting application data at rest
- Public cloud vs internal cloud security
- Lack of public SaaS version control

# Additional Issues

- Issues with moving PII and sensitive data to the cloud
  - Privacy impact assessments
- Using SLAs to obtain cloud security
  - Suggested requirements for cloud SLAs
  - Issues with cloud forensics
- Contingency planning and disaster recovery for cloud implementations
- Handling compliance
  - FISMA
  - HIPAA
  - SOX
  - PCI
  - SAS 70 Audits

# Migration Paths for Cloud Computing

# Migration Paths for Cloud Adoption

- Use public clouds
  - Option 1: as is with multi-tenancy
  - Option 2: no multi-tenancy of servers or storage + enhanced organization defined security
- Develop private clouds
  - Procure an external private cloud
  - Migrate data centers to be private clouds (fully virtualized)
- Use hybrid-cloud technology
  - Leverage a private and public cloud architectures
  - Workload portability between private and public clouds
- Build or procure community clouds

# Possible Effects of Cloud Computing

- Small enterprises use public SaaS and public clouds and minimize growth of data centers
- Large enterprise data centers may evolve to act as internal clouds
- Large enterprises may use hybrid cloud infrastructure software to leverage both internal and public clouds
- Public clouds may adopt standards in order to run workloads from competing hybrid cloud infrastructures

# A proposal: The Cloud Interoperability Profile

- We need to define minimal standards
  - Enable cloud integration, application portability, and data portability
  - Avoid over specification that will inhibit innovation
- Let's create a blueprint for cloud design
  - Specifies versions of standards
  - Separately addresses different cloud models
- Example: WS-I Basic Profile for SOA
- Let's call it the "Cloud Interoperability Profile (CIP)" (pronounced 'sip')

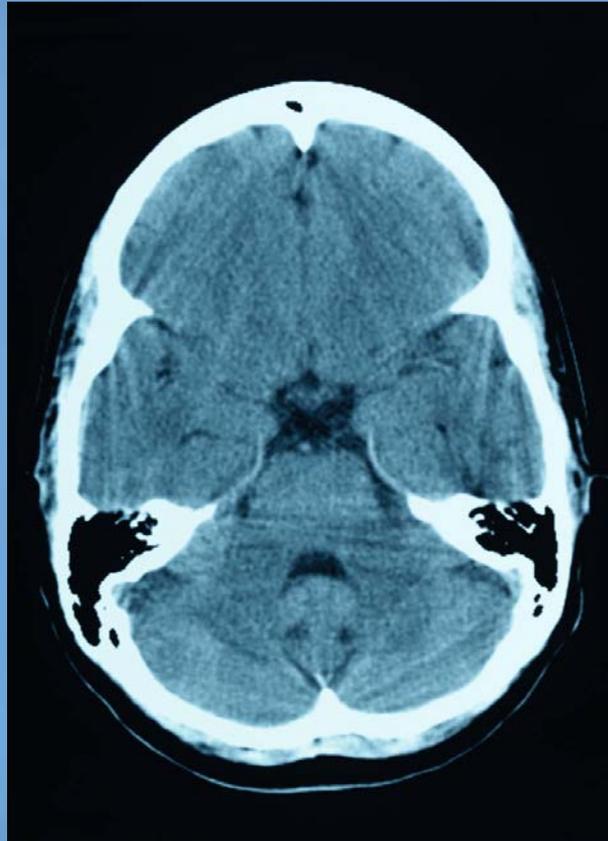

# Strategies for Enabling Effective Migration

- Provide guidance on secure and effective use
- Research cloud standards
- Create a cloud interoperability profile

# Part II: Cloud Resources, Case Studies, and Security Models

# Thoughts on Cloud Computing

# Thoughts on Cloud Computing

- Galen Gruman, InfoWorld Executive Editor, and Eric Knorr, InfoWorld Editor in Chief
  - “A way to increase capacity or add capabilities on the fly without investing in new infrastructure, training new personnel, or licensing new software.”
  - “The idea of loosely coupled services running on an agile, scalable infrastructure should eventually make every enterprise a node in the cloud.”

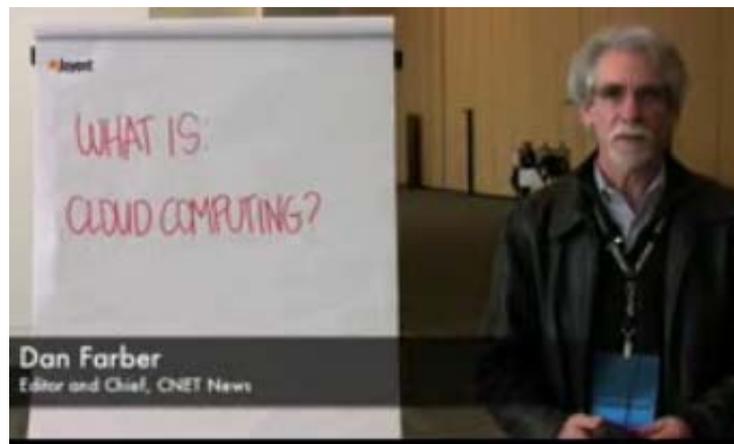

# Thoughts on Cloud Computing

- Tim O'Reilly, CEO O'Reilly Media
- “I think it is one of the foundations of the next generation of computing”
- “The network of networks is the platform for all computing”
- “Everything we think of as a computer today is really just a device that connects to the big computer that we are all collectively building”

# Thoughts on Cloud Computing

- Dan Farber, Editor in Chief CNET News
- “We are at the beginning of the age of planetary computing. Billions of people will be wirelessly interconnected, and the only way to achieve that kind of massive scale usage is by massive scale, **brutally efficient** cloud-based infrastructure.”

# Core objectives of Cloud Computing

- Amazon CTO Werner Vogels
- Core objectives and principles that cloud computing must meet to be successful:
  - Security
  - Scalability
  - Availability
  - Performance
  - Cost-effective
  - Acquire resources on demand
  - Release resources when no longer needed
  - Pay for what you use
  - Leverage others' core competencies
  - Turn fixed cost into variable cost

Amazon CTO Werner Vogels  
(Credit: Dan Farber)

# A “sunny” vision of the future

- Sun Microsystems CTO Greg Papadopoulos
  - Users will “trust” service providers with their data like they trust banks with their money
  - “Hosting providers [will] bring ‘brutal efficiency’ for utilization, power, security, service levels, and idea-to-deploy time” –CNET article
  - Becoming cost ineffective to build data centers
  - Organizations will rent computing resources
  - Envisions grid of 6 cloud infrastructure providers linked to 100 regional providers

# Foundational Elements of Cloud Computing

# Foundational Elements of Cloud Computing

## Primary Technologies

- Virtualization
- Grid technology
- Service Oriented Architectures
- Distributed Computing
- Broadband Networks
- Browser as a platform
- Free and Open Source Software

## Other Technologies

- Autonomic Systems
- Web 2.0
- Web application frameworks
- Service Level Agreements

# Web 2.0

- Is not a standard but an evolution in using the WWW
- “Don’t fight the Internet” – CEO Google, Eric Schmidt
- Web 2.0 is the trend of using the full potential of the web
  - Viewing the Internet as a computing platform
  - Running interactive applications through a web browser
  - Leveraging interconnectivity and mobility of devices
  - The “long tail” (profits in selling specialized small market goods)
  - Enhanced effectiveness with greater human participation
- Tim O'Reilly: “Web 2.0 is the business revolution in the computer industry caused by the move to the Internet as a platform, and an attempt to understand the rules for success on that new platform.”

# Software as a Service (SaaS)

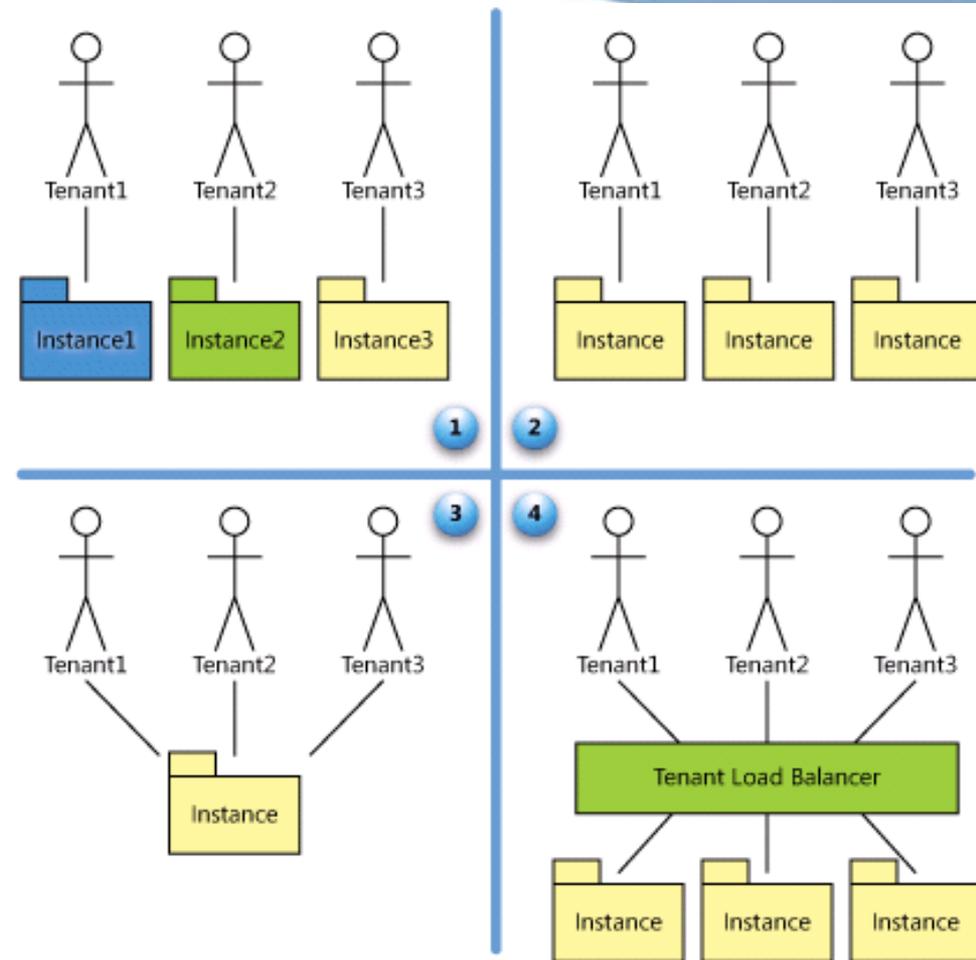

- SaaS is hosting applications on the Internet as a service (both consumer and enterprise)
- Jon Williams, CTO of Kaplan Test Prep on SaaS
  - “I love the fact that I don't need to deal with servers, staging, version maintenance, security, performance”
- Eric Knorr with Computerworld says that “[there is an] increasing desperation on the part of IT to minimize application deployment and maintenance hassles”

# Three Features of Mature SaaS Applications

- **Scalable**
  - Handle growing amounts of work in a graceful manner
- **Multi-tenancy**
  - One application instance may be serving hundreds of companies
  - Opposite of multi-instance where each customer is provisioned their own server running one instance
- **Metadata driven configurability**
  - Instead of customizing the application for a customer (requiring code changes), one allows the user to configure the application through metadata

# SaaS Maturity Levels

- Level 1: Ad-Hoc/Custom
- Level 2: Configurable
- Level 3: Configurable, Multi-Tenant-Efficient
- **Level 4: Scalable, Configurable, Multi-Tenant-Efficient**

# Utility Computing

- “Computing may someday be organized as a public utility” - John McCarthy, MIT Centennial in 1961
- Huge computational and storage capabilities available from utilities
- Metered billing (pay for what you use)
- Simple to use interface to access the capability (e.g., plugging into an outlet)

# Service Level Agreements (SLAs)

- Contract between customers and service providers of the level of service to be provided
- Contains performance metrics (e.g., uptime, throughput, response time)
- Problem management details
- Documented security capabilities
- Contains penalties for non-performance

# Autonomic System Computing

- Complex computing systems that manage themselves
- Decreased need for human administrators to perform lower level tasks
- Autonomic properties: Purposeful, Automatic, Adaptive, Aware
- IBM's 4 properties: self-healing, self-configuration, self-optimization, and self-protection

*IT labor costs are 18 times that of equipment costs.  
The number of computers is growing at 38% each year.*

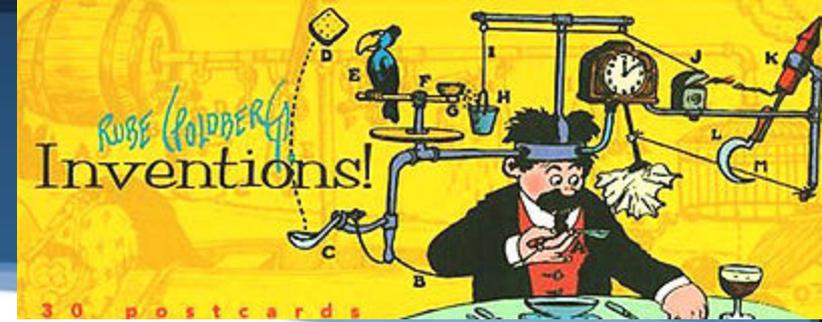

# Grid Computing

- Distributed parallel processing across a network
- Key concept: “the ability to negotiate resource-sharing arrangements”
- Characteristics of grid computing
  - Coordinates independent resources
  - Uses open standards and interfaces
  - Quality of service
  - Allows for heterogeneity of computers
  - Distribution across large geographical boundaries
  - Loose coupling of computers

# Platform Virtualization

- “[Cloud computing] relies on separating your applications from the underlying infrastructure” - Steve Herrod, CTO at VMware
- Host operating system provides an abstraction layer for running virtual guest OSs
- Key is the “hypervisor” or “virtual machine monitor”
  - Enables guest OSs to run in isolation of other OSs
  - Run multiple types of OSs
- Increases utilization of physical servers
- Enables portability of virtual servers between physical servers
- Increases security of physical host server

# Web Services

- Web Services
  - Self-describing and stateless modules that perform discrete units of work and are available over the network
  - “Web service providers offer APIs that enable developers to exploit functionality over the Internet, rather than delivering full-blown applications.” - Infoworld
  - Standards based interfaces (WS-I Basic Profile)
    - e.g., SOAP, WSDL, WS-Security
    - Enabling state: WS-Transaction, Choreography
  - Many loosely coupled interacting modules form a single logical system (e.g., legos)

# Service Oriented Architectures

- Service Oriented Architectures
  - Model for using web services
    - service requestors, service registry, service providers
  - Use of web services to compose complex, customizable, distributed applications
  - Encapsulate legacy applications
  - Organize stovepiped applications into collective integrated services
  - Interoperability and extensibility

# Web application frameworks

- Coding frameworks for enabling dynamic web sites
  - Streamline web and DB related programming operations (e.g., web services support)
  - Creation of Web 2.0 applications
- Supported by most major software languages
- Example capabilities
  - Separation of business logic from the user interface (e.g., Model-view-controller architecture)
  - Authentication, Authorization, and Role Based Access Control (RBAC)
  - Unified APIs for SQL DB interactions
  - Session management
  - URL mapping
- Wikipedia maintains a list of web application frameworks

# Free and Open Source Software

- External ‘mega-clouds’ must focus on using their massive scale to reduce costs
- Usually use free software
  - Proven adequate for cloud deployments
  - Open source
  - Owned by provider
- Need to keep per server cost low
  - Simple commodity hardware
    - Handle failures in software

# Cloud Economics

# Cost of Traditional Data Centers

- 11.8 million servers in data centers
- Servers are used at only 15% of their capacity
- 800 billion dollars spent yearly on purchasing and maintaining enterprise software
- 80% of enterprise software expenditure is on installation and maintenance of software
- Data centers typically consume up to 100 times more per square foot than a typical office building
- Average power consumption per server quadrupled from 2001 to 2006.
- Number of servers doubled from 2001 to 2006

# Energy Conservation and Data Centers

- Standard 9000 square foot costs \$21.3 million to build with \$1 million in electricity costs/year
- Data centers consume 1.5% of our Nation's electricity (EPA)
  - .6% worldwide in 2000 and 1% in 2005
- Green technologies can reduce energy costs by 50%
- IT produces 2% of global carbon dioxide emissions

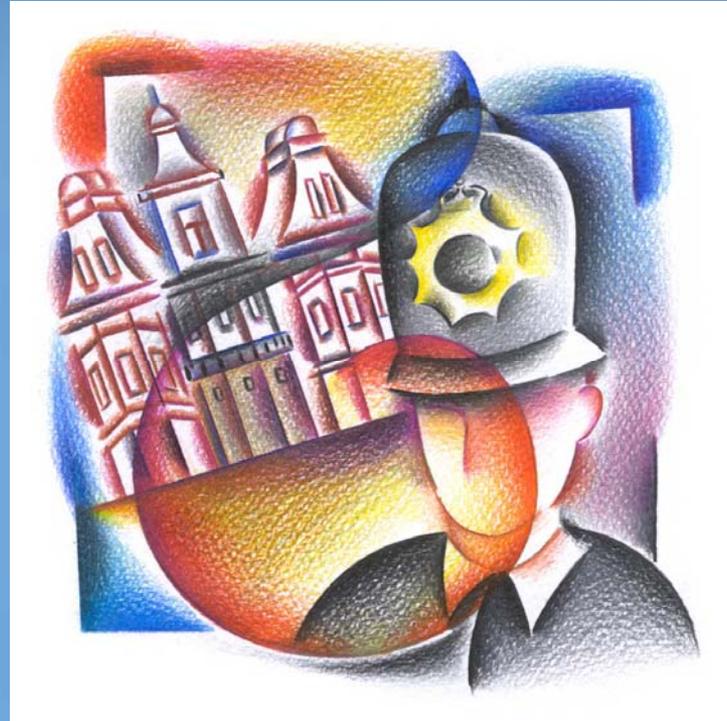

# Cloud Economics

- Estimates vary widely on possible cost savings
- “If you move your data centre to a cloud provider, it will cost a tenth of the cost.” – Brian Gammage, Gartner Fellow
- Use of cloud applications can reduce costs from 50% to 90% - CTO of Washington D.C.
- IT resource subscription pilot saw 28% cost savings - Alchemy Plus cloud (backing from Microsoft)
- Preferred Hotel
  - Traditional: \$210k server refresh and \$10k/month
  - Cloud: \$10k implementation and \$16k/month

# Cloud Economics

- George Reese, founder Valtira and enStratus
  - Using cloud infrastructures saves 18% to 29% before considering that you no longer need to buy for peak capacity

# Cloud Computing Case Studies and Security Models

# Google Cloud User: City of Washington D.C.

- Vivek Kundra, CTO for the District (now OMB e-gov administrator)
- Migrating 38,000 employees to Google Apps
- Replace office software
  - Gmail
  - Google Docs (word processing and spreadsheets)
  - Google video for business
  - Google sites (intranet sites and wikis)
- “It's a fundamental change to the way our government operates by moving to the cloud. Rather than owning the infrastructure, we can save millions.”, Mr. Kundra
- 500,000+ organizations use Google Apps
- GE moved 400,000 desktops from Microsoft Office to Google Apps and then migrated them to Zoho for privacy concerns

# Are Hybrid Clouds in our Future?

- OpenNebula
- Zimory
- IBM-Juniper Partnership
  - "demonstrate how a hybrid cloud could allow enterprises to seamlessly extend their private clouds to remote servers in a secure public cloud..."
- VMWare VCloud
  - "Federate resources between internal IT and external clouds"

# vCloud Initiative

- Goal:
  - “Federate resources between internal IT and external clouds”
  - Application portability
  - Elasticity and scalability, disaster recovery, service level management
- vServices provide APIs and technologies
- Appears to enable portability between cloud providers but locks applications into VMWare technologies
- BT, Rackspace, Verizon, SunGard, SAVVIS, T-Systems and 100+ partners

# Windows Azure Applications, Storage, and Roles

Source: Microsoft Presentation, A Lap Around Windows Azure, Manuvir Das

# Case Study: Facebook's Use of Open Source and Commodity Hardware (8/08)

- Jonathan Heiliger, Facebook's vice president of technical operations
- 80 million users + 250,000 new users per day
- 50,000 transactions per second, 10,000+ servers
- Built on open source software
  - Web and App tier: Apache, PHP, AJAX
  - Middleware tier: Memcached (Open source caching)
  - Data tier: MySQL (Open source DB)
- Thousands of DB instances store data in distributed fashion (avoids collisions of many users accessing the same DB)
- “We don't need fancy graphics chips and PCI cards,” he said. “We need one USB port and optimized power and airflow. Give me one CPU, a little memory and one power supply. If it fails, I don't care. We are solving the redundancy problem in software.”

# Case Study: IBM-Google Cloud (8/08)

- “Google and IBM plan to roll out a worldwide network of servers for a cloud computing infrastructure” – Infoworld
- Initiatives for universities
- Architecture
  - Open source
    - Linux hosts
    - Xen virtualization (virtual machine monitor)
    - Apache Hadoop (file system)
      - “open-source software for reliable, scalable, distributed computing”
  - IBM Tivoli Provisioning Manager

# Case Study: Amazon Cloud

- Amazon cloud components
  - Elastic Compute Cloud (EC2)
  - Simple Storage Service (S3)
  - SimpleDB
- New Features
  - Availability zones
    - Place applications in multiple locations for failovers
  - Elastic IP addresses
    - Static IP addresses that can be dynamically remapped to point to different instances (not a DNS change)

# Amazon Cloud Users: New York Times and Nasdaq

(4/00)

- Both companies used Amazon's cloud offering
- New York Times
  - Didn't coordinate with Amazon, used a credit card!
  - Used EC2 and S3 to convert 15 million scanned news articles to PDF (4TB data)
  - Took 100 Linux computers 24 hours (would have taken months on NYT computers)
  - "It was cheap experimentation, and the learning curve isn't steep." – Derrick Gottfrid, Nasdaq
- Nasdaq
  - Uses S3 to deliver historic stock and fund information
  - Millions of files showing price changes of entities over 10 minute segments
  - "The expenses of keeping all that data online [in Nasdaq servers] was too high." – Claude Courbois, Nasdaq VP
  - Created lightweight Adobe AIR application to let users view data

# Questions?

- Peter Mell
- NIST, Information Technology Laboratory
- Computer Security Division
  
- Tim Grance
- NIST, Information Technology Laboratory
- Computer Security Division
