## Authority

Moved (insertion) [1]

This publication has been developed by NIST to further its statutory responsibilities under the Federal Information Security Management Act (FISMA), Public Law (P.L.) 107-347. NIST is responsible for developing information security standards and guidelines, including minimum requirements for Federal information systems, but such standards and guidelines shall not apply to national security systems without the express approval of appropriate Federal officials exercising policy authority over such systems. This guideline is consistent with the requirements of the Office of Management and Budget (OMB) Circular A-130, Section 8b(3), *Securing Agency Information Systems*, as analyzed in Circular A-130, Appendix IV: *Analysis of Key Sections*. Supplemental information is provided in Circular A-130, Appendix III, *Security of Federal Automated Information Resources*.

Nothing in this publication should be taken to contradict the standards and guidelines made mandatory and binding on Federal agencies by the Secretary of Commerce under statutory authority. Nor should these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of Commerce, Director of the OMB, or any other Federal official. This publication may be used by nongovernmental organizations on a voluntary basis and is not subject to copyright in the United States. Attribution would, however, be appreciated by NIST.

## Reports on Computer Systems Technology

The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation’s measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of concept implementations, and technical analyses to advance the development and productive use of information technology. ITL’s responsibilities include the development of management, administrative, technical, and physical standards and guidelines for the cost-effective security and privacy of other than national security-related information in Federal information systems. The Special Publication 800-series reports on ITL’s research, guidelines, and outreach efforts in information system security, and its collaborative activities with industry, government, and academic organizations.

### Abstract

This Recommendation provides cryptographic key management guidance. It consists of three parts. Part 1 provides general guidance and best practices for the management of cryptographic keying material. Part 2 provides guidance on policy and security planning requirements for U.S. government agencies. Finally, Part 3 provides guidance when using the cryptographic features of current systems.

### Keywords

archive; assurances; authentication; authorization; availability; backup; compromise; confidentiality; cryptanalysis; cryptographic key; cryptographic module; digital signature; hash function; key agreement; key management; key management policy; key recovery; key transport; originator-usage period; private key; public key; recipient-usage period; secret key; split knowledge; trust anchor.

### Acknowledgements

The National Institute of Standards and Technology (NIST) gratefully acknowledges and appreciates contributions by previous authors of this document on the many security issues associated with this Recommendation: William Barker, William Burr, and Timothy Polk from NIST; Miles Smid from Orion Security; and Lydia Ziegler from the National Security Agency. NIST also thanks the many contributions by the public and private sectors whose thoughtful and constructive comments improved the quality and usefulness of this publication.

Conformance testing for implementations of this Recommendation will be conducted within the framework of the Cryptographic Algorithm Validation Program (CAVP) and the Cryptographic Module Validation Program (CMVP). The requirements of this Recommendation are indicated by the word “shall.” Some of these requirements may be out-of-scope for CMVP or CAVP validation testing, and thus are the responsibility of entities using, implementing, installing or configuring applications that incorporate this Recommendation.¶

## Overview

The proper management of cryptographic keys is essential to the effective use of cryptography for security. Keys are analogous to the combination of a safe. If a safe combination is known to an adversary, the strongest safe provides no security against penetration. Similarly, poor key management may easily compromise strong algorithms. Ultimately, the security of information protected by cryptography directly depends on the strength of the keys, the effectiveness of mechanisms and protocols associated with [the](#) keys, and the protection afforded to the keys. All keys need to be protected against modification, and secret and private keys need to be protected against unauthorized disclosure. Key management provides the foundation for the secure generation, storage, distribution, use and destruction of keys.

Users and developers are presented with many choices in their use of cryptographic mechanisms. Inappropriate choices may result in an illusion of security, but little or no real security for the protocol or application. This Recommendation (i.e., SP 800-57) provides background information and establishes frameworks to support appropriate decisions when selecting and using cryptographic mechanisms.

This Recommendation does not address [the](#) implementation details for cryptographic modules that may be used to achieve the security requirements identified. These details are addressed in [Federal Information Processing Standard \(FIPS\) 140 \[FIPS 140\]](#), the associated implementation guidance and the derived test requirements (available at <http://csrc.nist.gov/groups/STM/cmvp/standards.html>).

Deleted: [FIPS140].

Deleted: cryptval/).

This Recommendation is written for several different audiences and is divided into three parts.

Part 1, *General*, contains basic key management guidance. It is intended to advise developers and system administrators on the "best practices" associated with key management. Cryptographic module developers may benefit from this general guidance by obtaining a greater understanding of the key management features that are required to support specific, intended ranges of applications. Protocol developers may identify key management characteristics associated with specific suites of algorithms and gain a greater understanding of the security services provided by those algorithms. System administrators may use this document to determine which configuration settings are most appropriate for their information. Part 1 of the Recommendation:

1. Defines the security services that may be provided and key types that may be employed in using cryptographic mechanisms.
2. Provides background information regarding the cryptographic algorithms that use cryptographic keying material.
3. Classifies the different types of keys and other cryptographic information according to their functions, specifies the protection that each type of information requires and identifies methods for providing this protection.
4. Identifies the states in which a cryptographic key may exist during its lifetime.
5. Identifies the multitude of functions involved in key management.

September 2015

6. Discusses a variety of key management issues related to the keying material. Topics discussed include key usage, cryptoperiod length, domain-parameter validation, public-key validation, accountability, audit, key management system survivability, and guidance for cryptographic algorithm and key size selection.

Part 2, *General Organization and Management Requirements*, is intended primarily to address the needs of system owners and managers. It provides a framework and general guidance to support establishing cryptographic key management within an organization and a basis for satisfying [the](#) key management aspects of statutory and policy security planning requirements for Federal government organizations.

Part 3, *Implementation-Specific Key Management Guidance*, is intended to address the key management issues associated with currently available implementations.

# RECOMMENDATION FOR KEY MANAGEMENT

## Part 1: General

### 1 Introduction

Cryptographic mechanisms are one of the strongest ways to provide security services for electronic applications and protocols and for data storage. The National Institute of Standards and Technology (NIST) publishes Federal Information Processing Standards (FIPS) and NIST Recommendations (which are published as Special Publications) that specify cryptographic techniques for protecting sensitive, unclassified information.

Since NIST published the Data Encryption Standard (DES) in 1977, the suite of **approved** standardized algorithms has been growing. New classes of algorithms have been added, such as secure hash functions and asymmetric key algorithms for digital signatures. The suite of algorithms now provides different levels of cryptographic strength through a variety of key sizes. The algorithms may be combined in many ways to support increasingly complex protocols and applications. This NIST Recommendation applies to U.S. government agencies using cryptography for the protection of their sensitive, unclassified information. This Recommendation may also be followed, on a voluntary basis, by other organizations that want to implement sound security principles in their computer systems.

The proper management of cryptographic keys is essential to the effective use of cryptography for security. Keys are analogous to the combination of a safe. If the combination is known by an adversary, the strongest safe provides no security against penetration. Similarly, poor key management may easily compromise strong algorithms. Ultimately, the security of information protected by cryptography directly depends on the strength of the keys, the effectiveness of mechanisms and protocols associated with the keys, and the protection afforded the keys. Cryptography can be rendered ineffective by the use of weak products, inappropriate algorithm pairing, poor physical security, and the use of weak protocols.

All keys need to be protected against unauthorized substitution and modification. Secret and private keys need to be protected against unauthorized disclosure. Key management provides the foundation for the secure generation, storage, distribution, and destruction of keys.

#### 1.1 Goal/Purpose

Users and developers are presented with many new choices in their use of cryptographic mechanisms. Inappropriate choices may result in an illusion of security, but little or no real security for the protocol or application. This Recommendation (i.e., SP 800-57), provides background information and establishes frameworks to support appropriate decisions when selecting and using cryptographic mechanisms.

**Deleted:** Basic key management guidance is provided in [SP800-21].

**Deleted:** expands on that guidance,

#### 1.2 Audience

The audiences for this *Recommendation for Key Management* include system or application owners and managers, cryptographic module developers, protocol developers, and system

43 administrators. The Recommendation has been provided in three parts. The different parts into  
44 which the Recommendation has been divided have been tailored to specific audiences.

45 Part 1 of this Recommendation provides general key management guidance that is intended to  
46 be useful to both system developers and system administrators. Cryptographic module  
47 developers may benefit from this general guidance through a greater understanding of the key  
48 management features that are required to support specific intended ranges of applications.  
49 Protocol developers may identify key management characteristics associated with specific  
50 suites of algorithms and gain a greater understanding of the security services provided by those  
51 algorithms. System administrators may use this Recommendation to determine which  
52 configuration settings are most appropriate for their information.

53 Part 2 of this Recommendation [\[SP800-57, Part 2\]](#) is tailored for system or application owners  
54 for use in identifying appropriate organizational key management infrastructures, establishing  
55 organizational key management policies, and specifying organizational key management  
56 practices and plans.

57 Part 3 of this Recommendation addresses the key management issues associated with currently  
58 available cryptographic mechanisms and is intended to provide guidance to system installers,  
59 system administrators and end users of existing key management infrastructures, protocols, and  
60 other applications, as well as the people making purchasing decisions for new systems using  
61 currently available technology.

62 Though some background information and rationale are provided for context and to support the  
63 recommendations, this document assumes that the reader has a basic understanding of  
64 cryptography. For background material, readers may look to a variety of NIST and commercial  
65 publications, [including \[SP800-32\]](#), which provides an introduction to a public-key  
66 infrastructure.

Deleted: . [SP800-21] includes a brief introduction to cryptography. [SP800-32]

Deleted: A mathematical review of cryptography and cryptographic algorithms is found in [HAC] and [AC].

### 67 1.3 Scope

68 This Recommendation encompasses cryptographic algorithms, infrastructures, protocols, and  
69 applications, and the management thereof. All cryptographic algorithms currently **approved** by  
70 NIST for the protection of unclassified, but sensitive information are in scope.

71 This Recommendation focuses on issues involving the management of cryptographic keys:  
72 their generation, use, and eventual destruction. Related topics, such as algorithm selection and  
73 appropriate key size, cryptographic policy, and cryptographic module selection, are also  
74 included in this Recommendation. Some of the topics noted above are addressed in other NIST  
75 standards and guidance. This Recommendation supplements more-focused standards and  
76 guidelines.

77 This Recommendation does not address the implementation details for cryptographic modules  
78 that may be used to achieve the security requirements identified. These details are addressed in  
79 [\[FIPS140\]](#), the FIPS 140 implementation guidance and the derived test requirements (available  
80 at <http://csrc.nist.gov/groups/STM/cmvp/standards.html>).

Deleted: [SP800-21], [FIPS140],

Deleted: cryptval/).

81 This Recommendation also does not address the requirements or procedures for operating an  
82 archive, other than discussing the types of keying material that are appropriate to include in an  
83 archive and the protection to be provided to the archived keying material.

92 This Recommendation often uses “requirement” terms; these terms have the following  
93 meaning in this document:

- 94 1. **shall**: This term is used to indicate a requirement of a Federal Information Processing  
95 Standard (FIPS) or a requirement that must be fulfilled to claim conformance to this  
96 Recommendation. Note that **shall** may be coupled with **not** to become **shall not**.
- 97 2. **should**: This term is used to indicate an important recommendation. Ignoring the  
98 recommendation could result in undesirable results. Note that **should** may be coupled  
99 with **not** to become **should not**.

100 **1.4 Purpose of FIPS and NIST Recommendations (NIST Standards)**

101 Federal Information Processing Standards (FIPS) and NIST Recommendations, collectively  
102 referred to as "NIST standards," are valuable because:

**Deleted:** security standards

103 1. They establish an acceptable minimal level of security for U.S. government systems.  
104 Systems that implement these NIST standards offer a consistent level of security  
105 **approved** for the protection of sensitive, unclassified government data.

**Deleted:** Standards and Recommendations

106 2. They often establish some level of interoperability between different systems that  
107 implement the NIST standard. For example, two products that both implement the  
108 Advanced Encryption Standard (AES) cryptographic algorithm have the potential to  
109 interoperate, provided that the other functions of the product are compatible.

**Deleted:** Standard or Recommendation.

110 3. They often provide for scalability, because the U.S. government requires products and  
111 techniques that can be effectively applied in large numbers.

112 4. They are scrutinized by U.S. government experts and the public to ensure that they  
113 provide a high level of security. The NIST standards process invites broad public  
114 participation, not only through the formal NIST public review process before adoption,  
115 but also by interaction with the open cryptographic community through NIST  
116 workshops, participation in voluntary standards development organizations,  
117 participation in cryptographic research conferences and informal contacts with  
118 researchers. NIST encourages study and cryptanalysis of NIST Standards, and inputs  
119 on their security are welcome at any point, from initial requirements, during  
120 development and after adoption.

**Deleted:** 4. They are scrutinized by the U.S. government to ensure that they provide an adequate level of security. This review is performed by U.S. government experts, in addition to the reviews performed by the public.¶

121 5. NIST-**approved** cryptographic techniques are periodically re-assessed for their  
122 continued effectiveness. If any technique is found to be inadequate for the continued  
123 protection of government information, the NIST standard is revised or discontinued.

**Deleted:** Standard or Recommendation

124 6. The algorithms specified in NIST standards (e.g., AES, TDEA, SHA-1, and DSA) and  
125 the cryptographic modules in which they reside have required conformance tests. These  
126 tests are performed by accredited laboratories on vendor implementations that claim  
127 conformance to the standards. Vendors are permitted to modify non-conforming  
128 implementations so that they meet all applicable requirements. Users of validated  
129 implementations can have a high degree of confidence that validated implementations  
130 conform to the standards.

## 151 | 1.5 Content and Organization

152 | Part 1, *General Guidance*, contains basic key management guidance. It is intended to advise  
153 | developers and system administrators on the "best practices" associated with key management.

154 | 1. [Section 1](#), *Introduction*, establishes the purpose, scope and intended audience of the  
155 | *Recommendation for Key Management*

Deleted: Section 1,

156 | 2. [Section 2](#), *Glossary of Terms and Acronyms*, provides definitions of terms and  
157 | acronyms used in this part of the *Recommendation for Key Management*. The reader  
158 | should be aware that the terms used in this Recommendation might be defined  
159 | differently in other documents.

Deleted: Section 2,

160 | 3. [Section 3](#), *Security Services*, defines the security services that may be provided using  
161 | cryptographic mechanisms.

Deleted: Section 3,

162 | 4. [Section 4](#), *Cryptographic Algorithms*, provides background information regarding the  
163 | cryptographic algorithms that use cryptographic keying material.

Deleted: Section 4,

164 | 5. [Section 5](#), *General Key Management Guidance*, classifies the different types of keys  
165 | and other cryptographic information according to their uses, discusses cryptoperiods  
166 | and recommends appropriate cryptoperiods for each key type, provides  
167 | recommendations and requirements for other keying material, introduces assurance of  
168 | domain-parameter and public-key validity, discusses the implications of the  
169 | compromise of keying material, and provides guidance on cryptographic algorithm  
170 | strength selection implementation and replacement.

Deleted: Section 5,

171 | 6. [Section 6](#), *Protection Requirements for Cryptographic Information*, specifies the  
172 | protection that each type of information requires and identifies methods for providing  
173 | this protection. These protection requirements are of particular interest to cryptographic  
174 | module vendors and application implementers.

Deleted: Section 6,

175 | 7. [Section 7](#), *Key State and Transitions*, identifies the states in which a cryptographic key  
176 | may exist during its lifetime.

Deleted: Section 7,

177 | 8. [Section 8](#), *Key Management Phases and Functions*, identifies four phases and a  
178 | multitude of functions involved in key management. This section is of particular  
179 | interest to cryptographic module vendors and developers of cryptographic infrastructure  
180 | services.

Deleted: Section 8,

181 | 9. [Section 9](#), *Accountability, Audit, and Survivability*, discusses three control principles  
182 | that are used to protect the keying material identified in Section 5.1.

Deleted: Section 9,

183 | 10. [Section 10](#), *Key Management Specifications for Cryptographic Devices or*  
184 | *Applications*, specifies the content and requirements for key management

## 204 2 Glossary of Terms and Acronyms

205 The definitions provided below are defined as used in this document. The same terms may be  
 206 defined differently in other documents.

### 207 2.1 Glossary

Access control	Restricts access to resources to only privileged entities.
Accountability	A property that ensures that the actions of an entity may be traced uniquely to that entity.
Algorithm originator-usage period	The period of time during which a specific cryptographic algorithm may be used by originators to apply protection to data <a href="#">(e.g., encrypt or generate a digital signature)</a> .
Algorithm security lifetime	The estimated time period during which data protected by a specific cryptographic algorithm remains secure.
Approved	FIPS- <b>approved</b> and/or NIST-recommended. An algorithm or technique that is either 1) specified in a FIPS or NIST Recommendation, or 2) specified elsewhere and adopted by reference in a FIPS or NIST Recommendation.
Archive	<a href="#">1. To place information into long-term storage.</a> <a href="#">2. A location or media used for long-term storage.</a>
Association	A relationship for a particular purpose. For example, a key is associated with the application or process for which it will be used.
Assurance of (private key) possession	Confidence that an entity possesses a private key and its associated keying material.
Assurance of validity	Confidence that a public key or domain parameter is arithmetically correct.
Asymmetric key algorithm	See Public-key cryptographic algorithm.
Authentication	A process that provides assurance of <a href="#">the source and integrity of information in</a> communications sessions, messages, documents or stored data.
Authentication code	A <a href="#">keyed</a> cryptographic checksum based on an <b>approved</b> security function (also known as a Message Authentication Code).

Deleted: .

Deleted: Also, see Key management archive.

Deleted: Attribute

Deleted: establishes the source of information,

Deleted: an entity's identity or provides assurance of the

Authorization	Access privileges that are granted to an entity; conveying an “official” sanction to perform a security function or activity.
Availability	Timely, reliable access to information by authorized entities.
Backup	A copy of information to facilitate recovery during the cryptoperiod of the key, if necessary.
Certificate	See Public-key certificate.
Certification authority	The entity in a Public Key Infrastructure (PKI) that <a href="#">issues</a> certificates to <a href="#">certificate subjects</a> .
Ciphertext	Data in its encrypted form.
Collision	Two or more distinct inputs produce the same output. Also see Hash function.
Compromise	The unauthorized disclosure, modification, substitution or use of sensitive data (e.g., keying material and other security-related information).
Confidentiality	The property that sensitive information is not disclosed to unauthorized entities.
Contingency plan	A plan that is maintained for disaster response, backup operations, and post-disaster recovery to ensure the availability of critical resources and to facilitate the continuity of operations in an emergency situation.
Contingency planning	The development of a contingency plan.
Cryptanalysis	<ol style="list-style-type: none"> <li>1. Operations performed <a href="#">to defeat</a> cryptographic protection without an initial knowledge of the key employed in providing the protection.</li> <li>2. The study of mathematical techniques for attempting to defeat cryptographic techniques and information system security. This includes the process of looking for errors or weaknesses in the implementation of an algorithm or in the algorithm itself.</li> </ol>
Cryptographic algorithm	A well-defined computational procedure that takes variable inputs, including a cryptographic key, and produces an output.
Cryptographic boundary	An explicitly defined continuous perimeter that establishes the physical bounds of a cryptographic module and contains all hardware, software, and/or firmware components of a cryptographic module.
Cryptographic hash function	See Hash function.

**Deleted:** is responsible for issuing

**Deleted:** and exacting compliance

**Deleted:** a PKI policy

**Deleted:** in defeating

Cryptographic key (key)	A parameter used in conjunction with a cryptographic algorithm that determines its operation in such a way that an entity with knowledge of the key can reproduce, reverse <u>or verify</u> the operation, while an entity without knowledge of the key cannot. Examples include: <ol style="list-style-type: none"> <li>1. The transformation of plaintext data into ciphertext data,</li> <li>2. The transformation of ciphertext data into plaintext data,</li> <li>3. The computation of a digital signature from data,</li> <li>4. The verification of a digital signature <u>on data</u>,</li> <li>5. The computation of an authentication code from data,</li> <li>6. The verification of an authentication code from data and a received authentication code,</li> <li>7. The computation of a shared secret that is used to derive keying material.</li> </ol>
Cryptographic key component (key component)	One of at least two parameters that have the same security properties (e.g., randomness) as a cryptographic key; parameters are combined in an <b>approved</b> security function to form a plaintext cryptographic key before use.
Cryptographic module	The set of hardware, software, and/or firmware that implements <b>approved</b> security functions (including cryptographic algorithms and key generation) and is contained within the cryptographic boundary.
Cryptoperiod	The time span during which a specific key is authorized for use or in which the keys for a given system or application may remain in effect.
<u>Data-encryption key</u>	<u>A key used to encrypt and decrypt information other than keys.</u>
Data integrity	A property whereby data has not been altered in an unauthorized manner since it was created, transmitted or stored.
Decryption	The process of changing ciphertext into plaintext using a cryptographic algorithm and key.
Deterministic random bit generator (DRBG)	<u>A random bit generator that includes a DRBG algorithm and (at least initially) has access to a source of randomness. The DRBG produces a sequence of bits from a secret initial value called a seed, along with other possible inputs.</u> A cryptographic DRBG has the additional property that the output is unpredictable, given that the seed is not known. A DRBG is sometimes also called a Pseudo Random Number Generator (PRNG) or a deterministic random number generator.

Deleted: or

Deleted: ¶  
In this Recommendation, the statement that a cryptographic algorithm "provides data integrity" means that the algorithm is used to detect unauthorized alterations.

Deleted: An

Deleted: that

Deleted: that are uniquely determined

Deleted: an

Deleted: . The output of the DRBG "appears" to be random, i.e., the output is statistically indistinguishable from random values

Digital signature	The result of a cryptographic transformation of data that, when properly implemented with a supporting infrastructure and policy, provides the services of: <ol style="list-style-type: none"> <li>1. Origin (<u>i.e., source</u>) authentication,</li> <li>2. Data integrity <u>authentication</u>, and</li> <li>3. <u>Support for</u> signer non-repudiation.</li> </ol>
Distribution	See Key distribution.
Domain parameter	A parameter used in conjunction with some public-key algorithms to generate key pairs, to create digital signatures, or to establish keying material.
Encrypted key	A cryptographic key that has been encrypted using an <b>approved</b> security function in order to disguise the value of the underlying plaintext key.
Encryption	The process of changing plaintext into ciphertext using a cryptographic algorithm and key.
Entity	An individual (person), organization, device or process.
Ephemeral key	A cryptographic key that is generated for each execution of a key-establishment process and that meets other requirements of the key type (e.g., unique to each message or session).  In some cases, ephemeral keys are used more than once within a single session (e.g., <u>for</u> broadcast applications) where the sender generates only one ephemeral key pair per message, and the private key is combined separately with each recipient's public key.
Hash-based message authentication code (HMAC)	A message authentication code that uses an <b>approved</b> keyed-hash function (i.e., <u>[FIPS 198]</u> ).
Hash function	A function that maps a bit string of arbitrary length to a fixed-length bit string. <b>Approved</b> hash functions satisfy the following properties: <ol style="list-style-type: none"> <li>1. (One-way) It is computationally infeasible to find any input that maps to any pre-specified output, and</li> <li>2. (Collision resistant) It is computationally infeasible to find any two distinct inputs that map to the same output.</li> </ol>
Hash value	The result of applying a hash function to information.
Identifier	A bit string that is associated with a person, device or organization. It may be an identifying name, or may be something more abstract (for example, a string consisting of an IP address and timestamp), depending on the application.
Identity	The distinguishing character or personality of an entity.

Deleted: with a key-encrypting key

Deleted: FIPS 198).

Initialization vector (IV)	A vector used in defining the starting point of a cryptographic process.
Integrity (also, Assurance of integrity)	See Data integrity.
<a href="#">Integrity authentication</a>	<a href="#">The process of providing assurance that data has not been modified since an authentication code was created for that data.</a>
<a href="#">Integrity protection</a>	<a href="#">See Integrity authentication.</a>
Key	See Cryptographic key.
Key agreement	A key-establishment procedure where resultant keying material is a function of information contributed by two or more participants, so that no party can predetermine the value of the keying material independently of <a href="#">any</a> other party's contribution.
Key component	See Cryptographic key component.
Key confirmation	A procedure <a href="#">used</a> to provide assurance to one party that another party actually possesses the same keying material and/or shared secret.
Key de-registration	A function in the lifecycle of keying material; the marking of all keying material records and associations to indicate that the key is no longer in use.
Key derivation	The process by which one or more keys are derived from either a pre-shared key, or a shared secret ( <a href="#">from a key-agreement scheme</a> ) and other information.
Key-derivation function	A function that, with the input of a cryptographic key or shared secret, and possibly other data, generates a binary string, called keying material.
Key-derivation key	A key used with a key-derivation function or method to derive additional keys. <a href="#">Sometimes</a> called a master key.
<a href="#">Key-derivation method</a>	<a href="#">A key-derivation function or other <b>approved</b> procedure for deriving keying material.</a>
Key destruction	To remove all traces of keying material so that it cannot be recovered by either physical or electronic means.
Key distribution	The transport of a key and other keying material from an entity that either owns or generates the key to another entity that is intended to use the key.
Key-encrypting key	A cryptographic key that is used for the encryption or decryption of other keys, <a href="#">to provide confidentiality protection</a> . Also see <a href="#">Key-wrapping key</a> .

Deleted: the

Deleted: Key attribute

Deleted: A function in the lifecycle of keying material;

Deleted: Also

Deleted: .

Key establishment	A function in the lifecycle of keying material; the process by which cryptographic keys are securely established among cryptographic modules using manual transport methods (e.g., key loaders), automated methods (e.g., key-transport and/or key-agreement protocols), or a combination of automated and manual methods.
Key length	<a href="#">The length of a key in bits</a> ; used interchangeably with “Key size”.
Key management	The activities involving the handling of cryptographic keys and other related security parameters (e.g., passwords) during the entire lifecycle of the keys, including their generation, storage, establishment, entry and output, use and destruction.
Key Management Policy	A high-level statement of organizational key management policies that identifies a high-level structure, responsibilities, governing standards, organizational dependencies and other relationships, and security policies.
Key Management Practices Statement	A document or set of <a href="#">documents</a> that describes, in detail, the organizational structure, responsible roles, and organization rules for the functions identified in the Key Management Policy.
Key pair	A public key and its corresponding private key; a key pair is used with a public-key algorithm.
Key recovery	A function in the lifecycle of keying material; mechanisms and processes that allow authorized entities to retrieve or reconstruct keying material from key backup or archive.
Key registration	A function in the lifecycle of keying material; the process of officially recording the keying material by a registration authority.
Key revocation	A function in the lifecycle of keying material; a process whereby a notice is made available to affected entities that keying material should be removed from operational use prior to the end of the established cryptoperiod of that keying material.
Key size	The length of a key in bits; used interchangeably with “Key length”.
Key transport	A key-establishment procedure whereby one party (the sender) selects and encrypts ( <a href="#">or wraps</a> ) the keying material and then distributes the material to another party (the receiver).  When used in conjunction with a public-key (asymmetric) algorithm, the keying material is encrypted using the public key of the receiver and subsequently decrypted using the private key of the receiver.  When used in conjunction with a symmetric algorithm, the keying material is encrypted with a key- <a href="#">wrapping</a> key shared by the two parties.
Key update	A function performed on a cryptographic key in order to compute a new <a href="#">key that is related to the old</a> key.

**Deleted:** and Recommendations

**Deleted:** documentation

**Deleted:** encrypting

**Deleted:** , but

**Deleted:** .

Key-usage period	For a symmetric key, either the originator-usage period or the recipient-usage period.
Key wrapping	A method of <a href="#">cryptographically protecting</a> keys <a href="#">using a symmetric key</a> that provides both confidentiality and integrity protection.
Key-wrapping key	A symmetric key-encrypting key <a href="#">that is used to provide both confidentiality and integrity protection</a> . Also see <a href="#">Key-encrypting key</a> .
Keying material	The data (e.g., keys and IVs) necessary to establish and maintain cryptographic keying relationships.
Manual key transport	A non-automated means of transporting cryptographic keys by physically moving a device <a href="#">or</a> document <a href="#">containing the key or key component</a> .
Master key	See Key-derivation key.
Message authentication code (MAC)	A cryptographic checksum on data that uses <a href="#">an approved security function and</a> a symmetric key to detect both accidental and intentional modifications of data.
Metadata	Information used to describe specific characteristics, constraints, acceptable uses and parameters of another data item (e.g., a cryptographic key).
<a href="#">NIST standards</a>	<a href="#">Federal Information Processing Standards (FIPS) and NIST Recommendations</a> .
Non-repudiation	A service <a href="#">using a digital signature</a> that is used to <a href="#">support a determination of whether a message was actually signed by a given entity</a> .
Operational phase (Operational use)	A phase in the lifecycle of keying material whereby keying material is used for standard cryptographic purposes.
Operational storage	The normal storage of operational keying material during its cryptoperiod.
Owner	For a static key pair, the entity that is associated with the public key and authorized to use the private key. For an ephemeral key pair, the owner is the entity that generated the public/private key pair. For a symmetric key, <a href="#">the owner is</a> any entity that is authorized to use the key.
Originator-usage period	The period of time in the cryptoperiod of a <a href="#">key</a> during which cryptographic protection may be applied to data.
Password	A string of characters (letters, numbers and other symbols) that are used to authenticate an identity, to verify access authorization or to derive cryptographic keys.
Period of protection	The period of time during which the integrity and/or confidentiality of a key needs to be maintained.

Plaintext	Intelligible data that has meaning and can be understood without the application of decryption.
Private key	A cryptographic key, used with a public-key cryptographic algorithm, <u>that</u> is uniquely associated with an entity and is not made public. In an asymmetric (public) cryptosystem, the private key <u>has</u> a <u>corresponding</u> public key. Depending on the algorithm, the private key may be used, for example, to: <ol style="list-style-type: none"> <li>1. Compute the corresponding public key,</li> <li>2. Compute a digital signature that may be verified by the corresponding public key,</li> <li>3. Decrypt keys that were encrypted by the corresponding public key, or</li> <li>4. Compute a shared secret during a key-agreement transaction.</li> </ol>
Proof of possession (POP)	A verification process whereby assurance is obtained that the owner of a key pair actually has the private key associated with the public key.
Pseudorandom number generator (PRNG)	See Deterministic random bit generator (DRBG).
Public key	A cryptographic key, used with a public-key cryptographic algorithm, that is uniquely associated with an entity and that may be made public. In an asymmetric (public) cryptosystem, the public key <u>has</u> a <u>corresponding</u> private key. The public key may be known by anyone and, depending on the algorithm, may be used, for example, to: <ol style="list-style-type: none"> <li>1. Verify a digital signature that is signed by the corresponding private key,</li> <li>2. Encrypt keys that can be decrypted using the corresponding private key, or</li> <li>3. Compute a shared secret during a key-agreement transaction.</li> </ol>
Public-key certificate	A set of data that uniquely identifies an entity, contains the entity's public key and possibly other information, and is digitally signed by a trusted party, thereby binding the public key to the entity. Additional information in the certificate could specify how the key is used and its cryptoperiod.
Public-key (asymmetric) cryptographic algorithm	A cryptographic algorithm that uses two related keys: a public key and a private key. The two keys have the property that determining the private key from the public key is computationally infeasible.
Public Key Infrastructure (PKI)	A framework that is established to issue, maintain and revoke public key certificates.

Deleted: , which

Deleted: is associated with

Deleted: is associated with

Random bit generator (RBG)	A device or algorithm that outputs a sequence of bits that <u>appears</u> to be statistically independent and unbiased. Also, see Random number generator.
Random number generator (RNG)	A process used to generate an unpredictable series of numbers. Also, <u>called</u> a Random bit generator (RBG).
Recipient-usage period	The period of time during the cryptoperiod of a key <u>in</u> which the protected information is processed ( <u>e.g., decrypted</u> ).
Registration authority	A trusted entity that establishes and vouches for the identity of a user.
Retention period	The minimum amount of time that a key or other cryptographically related information should be retained in the archive.
<u>RBG</u> seed	A <u>string of bits</u> that is used to initialize a <u>DRBG</u> . Also <u>just</u> called a <u>"seed."</u>
Secret key	A cryptographic key that is used with a secret-key (symmetric) cryptographic algorithm that is uniquely associated with one or more entities and is not made public. The use of the term "secret" in this context does not imply a classification level, but rather implies the need to protect the key from disclosure.
Secure communication protocol	A communication protocol that provides the appropriate confidentiality, <u>source</u> authentication, and <u>data</u> integrity protection.
Security domain	A system or subsystem that is under the authority of a single trusted authority. Security domains may be organized (e.g., hierarchically) to form larger domains.
Security life of data	The time period during which the security of the data needs to be protected (e.g., its confidentiality, integrity or availability).
Security services	Mechanisms used to provide confidentiality, <u>integrity</u> , <u>authentication</u> , <u>source authentication and/or support</u> non-repudiation of information.
Security strength (Also "bits of security")	A number associated with the amount of work (that is, the number of operations) that is required to break a cryptographic algorithm or system. In this Recommendation, the security strength is specified in bits and is a specific value from the set {80, 112, 128, 192, 256}. <u>Note that a security strength of 80 bits is not longer considered sufficiently secure.</u>
Seed	A secret value that is used to initialize a process (e.g., a <u>DRBG</u> ). Also see <u>RBG</u> seed.
Self-signed certificate	A public-key certificate whose digital signature may be verified by the public key contained within the certificate. The signature on a self-signed certificate protects the integrity of the data, but does not guarantee the authenticity of the information. The trust of self-signed certificates is based on the secure procedures used to distribute them.

<b>Shall</b>	This term is used to indicate a requirement of a Federal Information Processing Standard (FIPS) or a requirement that must be fulfilled to claim conformance to this Recommendation. Note that <b>shall</b> may be coupled with <b>not</b> to become <b>shall not</b> .
Shared secret	A secret value that has been computed using a key-agreement scheme and is used as input to a key-derivation function/method.
<b>Should</b>	This term is used to indicate a very important recommendation. Ignoring the recommendation could result in undesirable results. Note that <b>should</b> may be coupled with <b>not</b> to become <b>should not</b> .
Signature generation	The use of a digital signature algorithm and a private key to generate a digital signature on data.
Signature verification	The use of a digital signature algorithm and a public key to verify a digital signature on data.
<u>Source authentication</u>	<u>The process of providing assurance about the source of information. Sometimes called identity authentication or origin authentication.</u>
Split knowledge	<p>A process by which a cryptographic key is split into <math>n</math> multiple key components, <u>each of which provides</u> no knowledge of the original key. <u>The components</u> can be subsequently combined to recreate the original cryptographic key. If knowledge of <math>k</math> (where <math>k</math> is less than or equal to <math>n</math>) components is required to construct the original key, then knowledge of any <math>k-1</math> key components provides no information about the original key other than, possibly, its length.</p> <p>Note that in this <u>Recommendation</u>, split knowledge is not intended to cover key shares, such as those used in threshold or multi-party signatures.</p>
Static key	A key that is intended for use for a relatively long period of time and is typically intended for use in many instances of a cryptographic key-establishment scheme. Contrast with an Ephemeral key.
Symmetric key	A single cryptographic key that is used with a secret (symmetric) key algorithm.
Symmetric-key algorithm	A cryptographic algorithm that uses the same secret key for an operation and its complement (e.g., encryption and decryption).
System initialization	A function in the lifecycle of keying material; setting up and configuring a system for secure operation.

### 306 3 Security Services

307 Cryptography may be used to perform [or support](#) several basic security services:  
308 confidentiality, [integrity](#), [authentication](#), [source authentication](#), authorization and non-  
309 repudiation. These services may also be required to protect cryptographic keying material. In  
310 addition, there are other cryptographic and non-cryptographic mechanisms that are used to  
311 support these security services. In general, a single cryptographic mechanism may provide  
312 more than one service (e.g., the use of digital signatures can provide [integrity](#), [authentication](#),  
313 and [source authentication](#)), but not all services.

Deleted: data

Deleted: .

Deleted: .

Deleted: non-repudiation

#### 314 3.1 Confidentiality

315 Confidentiality is the property whereby information is not disclosed to unauthorized parties.  
316 Secrecy is a term that is often used synonymously with confidentiality. Confidentiality is  
317 achieved using encryption to render the information unintelligible except by authorized  
318 entities. The information may become intelligible again by using decryption. In order for  
319 encryption to provide confidentiality, the cryptographic algorithm and mode of operation must  
320 be designed and implemented so that an unauthorized party cannot determine the secret or

329 private keys associated with the encryption or be able to derive the plaintext directly without  
330 deriving any keys.

331 **3.2 Data Integrity**

332 Data integrity is a property whereby data has not been altered in an unauthorized manner since  
333 it was created, transmitted or stored. Alteration includes the insertion, deletion and substitution  
334 of data. Cryptographic mechanisms, such as message authentication codes or digital signatures,  
335 can be used to detect (with a high probability) both accidental modifications (e.g.,  
336 modifications that sometimes occur during noisy transmissions or by hardware memory  
337 failures) and deliberate modifications by an adversary. Non-cryptographic mechanisms are also  
338 often used to detect accidental modifications, but cannot be relied upon to detect deliberate  
339 modifications. A more detailed treatment of this subject is provided in [Appendix A](#).

**Deleted:** Appendix A.1.

340 In this Recommendation, the statement that a cryptographic algorithm "provides data integrity"  
341 means that the algorithm is used to detect unauthorized alterations. [Authenticating integrity is](#)  
342 [discussed in the next section.](#)

343 **3.3 Authentication**

344 [Two types of authentication services can be provided using cryptography: integrity](#)  
345 [authentication and source authentication.](#)

**Deleted:** Authentication is a service that is used to establish the origin and integrity

**Deleted:** information. That is,

- 346 • [An integrity authentication service is used to verify that data has not been modified,](#)  
347 [i.e., this service provides integrity protection.](#)
- 348 • [A source authentication service is used to](#) verify the identity of the user or system that  
349 [created information \(e.g., a transaction or message\).](#)

**Deleted:** ) or verify that the data has not been modified. This service supports the receiver in security-relevant decisions, such as "Is the sender an authorized user of this system?" or "Is the sender permitted to read sensitive information?"

350 Several cryptographic mechanisms may be used to provide authentication services. Most  
351 commonly, authentication is provided by digital signatures or message authentication codes;  
352 some key-agreement techniques also provide [an authentication service.](#)

**Deleted:** .

353 When multiple individuals are permitted to share the same [source](#) authentication information  
354 (such as a password or cryptographic key), it is sometimes called role-based authentication.  
355 See [\[FIPS140\]](#).

**Deleted:** [FIPS140].

356 **3.4 Authorization**

357 Authorization is concerned with providing an official sanction or permission to perform a  
358 security function or activity (e.g., [accessing a room](#)). [Authorization is considered as a security](#)  
359 [service that is often supported by a cryptographic service.](#) Normally, authorization is granted  
360 [after the execution of a successful source authentication<sup>2</sup> service.](#) A non-cryptographic analog  
361 of the interaction between [source](#) authentication and authorization is the examination of an  
362 individual's credentials to establish their identity ([the source authentication process](#)); [after](#)  
363 [verifying the individual's identity and verifying that the individual is authorized access to some](#)  
364 [resource, such as a locked room](#), the individual is then provided with the key or password that  
365 will allow access to [that room.](#)

**Deleted:** .

**Deleted:** following a process

**Deleted:** ); upon proving

**Deleted:** some resource, such as a locked room (authorization). Authentication can be used to authorize a role, rather than to identify an individual. Once authenticated to a role, an entity is authorized for all the privileges associated with the role.

<sup>2</sup> Sometimes referred to as identity authentication.

385 Source authentication can also be used to authorize a role (such as a system administrator or  
386 audit role), rather than to identify an individual. Once authenticated for a role, an entity is  
387 authorized for all the privileges associated with that role.

388 **3.5 Non-repudiation**

389 In key management, non-repudiation is a term associated with digital signature keys and digital  
390 certificates that bind the name of the certificate subject to a public key. When non-repudiation  
391 is indicated for a digital signature key, it means that the signatures created by that key support  
392 not only the usual integrity and source authentication services of digital signatures, but also  
393 may (depending upon the context of the signature) indicate commitment by the certificate  
394 subject, in the same sense that a handwritten signature on a document may indicate  
395 commitment to a contract.

**Deleted:** Non-repudiation is a service that is used to provide assurance of the integrity and origin of data in such a way that the integrity and origin can be verified by a third party. This service prevents an entity from successfully denying involvement in a previous action. Non-repudiation is supported cryptographically by the use of a digital signature that is calculated by a private key known only by the entity that computes the digital signature.¶

396 Digital signature keys in public key certificates may be designated in the certificate as digital  
397 signature or non-repudiation keys, or both. In practice, if non-repudiation is designated, a  
398 digital signature will normally also be designated.

399 A key for which only a digital signature is indicated (and non-repudiation is not indicated) is  
400 meant for source authentication, typically in a protocol such as TLS, where a certificate subject  
401 authenticates its identity by digitally signing a challenge with the private key. A key where  
402 only a digital signature is designated might also be used to sign an e-mail message to  
403 authenticate the source of that message. Regardless of the digital signature or non-repudiation  
404 designation, the digital signature can also be used to provide integrity authentication, as well.

405 If both digital signature and non-repudiation are indicated, that means that the key may be used  
406 not only to authenticate the source and provide integrity protection, but also, possibly, for  
407 “commitment,” in the sense of accepting or agreeing to some terms or conditions. Whether or  
408 not commitment is implied, when a non-repudiation key is used to sign a message, its intent is  
409 determined by the message contents and the circumstances surrounding the signature. This is  
410 similar to the determination of whether a handwritten signature is simply an acknowledgement  
411 of receipt, or an agreement to some terms or conditions.

412 Where non-repudiation is indicated, certificate policies commonly include provisions intended  
413 to ensure that only one copy of the private key exists, and no party, other than the certificate  
414 subject, ever has control of that private key. This is done to protect against repudiation of the  
415 signature on the grounds that some party other than the certificate subject might have executed  
416 the signature.

417 In reality, a determination of non-repudiation is a legal decision with many aspects to be  
418 considered. Cryptographic mechanisms can only be used as one element in this decision.

419 **3.6 Support Services**

420 These basic cryptographic security services often require other supporting services. For  
421 example, cryptographic services often require the use of key establishment and random number  
422 generation services.

423 **3.7 Combining Services**

424 In many applications, a combination of cryptographic services (confidentiality, integrity,  
425 authentication, source authentication, and support for non-repudiation) is desired. Designers of

**Deleted:** data  
**Deleted:** .  
**Deleted:** authorization

438 secure systems often begin by considering which security services are needed to protect the  
439 information contained within and processed by the system. After these services have been  
440 determined, the designer then considers what mechanisms will best provide these services. Not  
441 all mechanisms are cryptographic in nature. For example, physical security may be used to  
442 protect the confidentiality of certain types of data, and identification badges or biometric  
443 identification devices may be used for source authentication. However, cryptographic  
444 mechanisms consisting of algorithms, keys, and other keying material often provide the most  
445 cost-effective means of protecting the security of information. This is particularly true in  
446 applications where the information would otherwise be exposed to unauthorized entities.

Deleted: entity

447 When properly implemented, some cryptographic algorithms provide multiple services. The  
448 following examples illustrate this case:

- 449 1. A message authentication code (Section 4.2.3) can provide source authentication, as  
450 well as integrity authentication if the symmetric keys are unique to each pair of users.
- 451 2. A digital signature algorithm (Section 4.2.4) can provide source authentication and  
452 integrity authentication, as well as to support a non-repudiation decision.
- 453 3. Certain modes of encryption can provide confidentiality, integrity authentication, and  
454 source authentication when properly implemented. These modes **should** be specifically  
455 designed to provide these services.

Deleted: (Section 4.2.3)

Deleted: data

Deleted: (Section 4.2.4)

Deleted: data

Deleted: data

456 However, it is often the case that different algorithms need to be employed in order to provide  
457 all the desired services.

458 Example:

459 Consider a system where the secure exchange of information between pairs of Internet  
460 entities is needed. Some of the exchanged information requires just integrity protection,  
461 while other information requires both integrity and confidentiality protection. It is also a  
462 requirement that each entity that participates in an information exchange knows the identity  
463 of the other entity.

464 The designers of this example system decide that a Public Key Infrastructure (PKI) needs  
465 to be established and that each entity wishing to communicate securely is required to  
466 physically prove his or her identity to a Registration Authority (RA). This identity-proving  
467 process requires the presentation of proper credentials, such as a driver's license, passport  
468 or birth certificate. After establishing their correct identity, the individuals then generate a  
469 public static key pair in a smart card that is later used for key agreement. The public static  
470 key-agreement key is transferred from the smart card to the RA, where it is incorporated  
471 with the user identifier and other information into a digitally signed message for  
472 transmission to a Certification Authority (CA). The CA then composes the user's public-  
473 key certificate by signing the public key of the user and the user's identifier, along with  
474 other information. This certificate is returned to the public-key owner so that it may be  
475 used in conjunction with the private key (under the sole control of the owner) for source-  
476 authentication and key-agreement purposes.

Deleted: authenticate

Deleted: at

Deleted: authentication

Deleted: The authenticated

Deleted: of each net member

477 In this example, any two entities wishing to communicate may exchange public-key  
478 certificates containing public keys that are checked by verifying the CA's signature on the  
479 certificate (using the CA's public key). The public static key-agreement key of each of the  
480 two entities and each entity's own private static key-agreement key are then used in a key-

Deleted: entity

493 agreement scheme to produce a shared secret that is known by the two entities. The shared  
494 secret may then be used to derive one or more shared symmetric keys. If the mode of the  
495 symmetric-encryption algorithm is designed to support all the desired services, then only  
496 one shared key is necessary. Otherwise, multiple shared keys and algorithms are used, e.g.,  
497 one of the shared keys is used to encrypt for confidentiality, while another key is used for  
498 [data](#) integrity and [source](#) authentication. The receiver of the data protected by the key(s)  
499 has assurance that the data came from the other entity indicated by the public-key  
500 certificate, that the data remains confidential, and that the integrity of the data is preserved.

501 Alternatively, if confidentiality is not required, integrity, authentication, and [source](#)  
502 [authentication](#) can be attained by establishing a digital-signature key pair and  
503 corresponding certificate for each entity. The private signature key of the sender is used to  
504 sign the data, and the sender's public signature-verification key is used by the receiver to  
505 verify the signature. In this case, a single algorithm provides all three services.

506 The above example provides a basic sketch of how cryptographic algorithms may be used to  
507 support multiple security services. However, it can be easily seen that the security of such a  
508 system depends on many factors, including:

- 509 a. The strength of the entity's credentials (e.g., driver's license, passport or birth  
510 certificate) and [the identity authentication process](#),
- 511 b. The strength of the cryptographic algorithms used,
- 512 c. The degree of trust placed in the RA and the CA,
- 513 d. The strength of the key-establishment protocols, and
- 514 e. The care taken by the users in [generating their keys and](#) protecting [them](#) from  
515 unauthorized use.

516 Therefore, the design of a security system that provides the desired security services by making  
517 use of cryptographic algorithms and sound key-management techniques requires a high degree  
518 of skill and expertise.

## 519 4 Cryptographic Algorithms

520 FIPS-approved or NIST-recommended cryptographic algorithms **shall** be used whenever  
521 cryptographic services are required. These **approved** algorithms have received an intensive  
522 security analysis prior to their approval and continue to be examined to determine that the  
523 algorithms provide adequate security. Most cryptographic algorithms require cryptographic  
524 keys or other keying material. In some cases, an algorithm may be strengthened by the use of  
525 larger keys. This Recommendation advises the users of cryptographic mechanisms on the  
526 appropriate choices of algorithms and key sizes.

527 This section describes the **approved** cryptographic algorithms that provide security services,  
528 such as confidentiality, integrity, authentication, and [source authentication](#).

Deleted: authorization, non-repudiation

537 **4.1 Classes of Cryptographic Algorithms**

538 There are three basic classes of **approved** cryptographic algorithms: hash functions,  
 539 symmetric-key algorithms and asymmetric-key algorithms. The classes are defined by the  
 540 number of cryptographic keys that are used in conjunction with the algorithm.

541 Cryptographic hash functions do not require keys, for their basic operation. Hash functions  
 542 generate a relatively small digest (hash value) from a (possibly) large input in a way that is  
 543 fundamentally difficult to reverse (i.e., it is hard to find an input that will produce a given  
 544 output). Hash functions are used as building blocks for key management, for example,

Deleted: .

- 545 | 1. To provide source and integrity authentication services ([Section 4.2.3](#)) – the hash  
 546 function is used with a key to generate a message authentication code;
- 547 | 2. To compress messages for digital signature generation and verification ([Section 4.2.4](#));
- 548 | 3. To derive keys in key-establishment algorithms ([Section 4.2.5](#)); and
- 549 | 4. To generate deterministic random numbers ([Section 4.2.7](#)).

Deleted: data

Deleted: and integrity

Deleted: (Section 4.2.3)

Deleted: (Section 4.2.4);

Deleted: (Section 4.2.5);

Deleted: (Section 4.2.7).

550 Symmetric-key algorithms (sometimes known as secret-key algorithms) transform data in a  
 551 way that is fundamentally difficult to undo without knowledge of a secret key. The key is  
 552 “symmetric” because the same key is used for a cryptographic operation and its inverse (e.g.,  
 553 encryption and decryption). Symmetric keys are often known by more than one entity;  
 554 however, the key **shall not** be disclosed to entities that are not authorized access to the data  
 555 protected by that algorithm and key. Symmetric key algorithms are used, for example,

- 556 | 1. To provide data confidentiality ([Section 4.2.2](#)); the same key is used to encrypt and  
 557 decrypt data;
- 558 | 2. To provide source and integrity authentication services ([Section 4.2.3](#)) in the form of  
 559 Message Authentication Codes (MACs); the same key is used to generate the MAC and  
 560 to validate it. MACs normally employ either a symmetric key-encryption algorithm or a  
 561 cryptographic hash function as their cryptographic primitive;
- 562 | 3. As part of the key-establishment process ([Section 4.2.5](#)); and
- 563 | 4. To generate deterministic random numbers ([Section 4.2.7](#)).

Deleted: (Section 4.2.2);

Deleted: and integrity

Deleted: (Section 4.2.3)

Deleted: (Section 4.2.5);

Deleted: (Section 4.2.7).

564 Asymmetric-key algorithms, commonly known as public-key algorithms, use two related keys  
 565 (i.e., a key pair) to perform their functions: a public key and a private key. The public key may  
 566 be known by anyone; the private key **should** be under the sole control of the entity that “owns”  
 567 the key pair<sup>4</sup>. Even though the public and private keys of a key pair are related, knowledge of  
 568 the public key cannot be used to determine the private key. Asymmetric algorithms are used,  
 569 for example,

Deleted: <sup>3</sup>

Deleted: does not reveal

- 570 | 1. To compute digital signatures ([Section 4.2.4](#)), and
- 571 | 2. To establish cryptographic keying material ([Section 4.2.5](#))

Deleted: (Section 4.2.4);

Deleted: (Section 4.2.5); and

<sup>4</sup> Sometimes a key pair is generated by a party that is trusted by the key owner.

588 **4.2 Cryptographic Algorithm Functionality**

589 Security services are fulfilled using a number of different algorithms. In many cases, the same  
590 algorithm may be used to provide multiple services.

591 **4.2.1 Hash Functions**

592 Many algorithms and schemes that provide a security service use a hash function as a  
593 component of the algorithm. Hash functions can be found in digital signature algorithms (see  
594 [\[FIPS186\]](#), Keyed-Hash Message Authentication Codes (HMAC) (see [\[FIPS198\]](#), key-  
595 derivation functions/methods (see [\[SP800-56A\]](#), [\[SP800-56B\]](#), [\[SP800-56C\]](#) and [\[SP800-  
596 108\]](#), and random number generators (see [\[SP800-90\]](#)). **Approved** hash functions are defined  
597 in [\[FIPS180\]](#) and [\[FIPS202\]](#).

598 A hash function takes an input of arbitrary length and outputs a fixed-length value. Common  
599 names for the output of a hash function include hash value, hash, message digest, and digital  
600 fingerprint. The maximum number of input and output bits is determined by the design of the  
601 hash function. All **approved** hash functions are cryptographic hash functions. With a well-  
602 designed cryptographic hash function, it is not feasible to find a message that will produce a  
603 given hash value (pre-image resistance), nor is it feasible to find two messages that produce the  
604 same hash value (collision resistance).

605 Several hash functions are **approved** for Federal Government use and are defined in [\[FIPS180\]](#)  
606 and [FIPS 202](#). Algorithm standards need to specify either the appropriate size for the hash  
607 function or provide the hash-function selection criteria if the algorithm can be configured to  
608 use different hash functions.

609 **4.2.2 Symmetric-Key Algorithms used for Encryption and Decryption**

610 Encryption is used to provide confidentiality for data. The data to be protected is called  
611 plaintext when in its original form. Encryption transforms the data into ciphertext. Ciphertext  
612 can be transformed back into plaintext using decryption. The **approved** algorithms for  
613 encryption/decryption are symmetric key algorithms: AES and TDEA. Each of these  
614 algorithms operates on blocks (chunks) of data during an encryption or decryption operation.  
615 For this reason, these algorithms are commonly **called** block cipher algorithms.

616 **4.2.2.1 Advanced Encryption Standard (AES)**

617 The AES algorithm is specified in [\[FIPS197\]](#). AES encrypts and decrypts data in 128-bit  
618 blocks, using 128, 192 or 256-bit keys. The nomenclature for AES for the different key sizes is  
619 AES-*x*, where *x* is the key size, (e.g., [AES-256](#)). All three key sizes are considered adequate for  
620 [most](#) Federal Government applications.

621 **4.2.2.2 Triple DEA (TDEA)**

622 Triple DEA is defined in [\[SP800-67\]](#). TDEA encrypts and decrypts data in 64-bit blocks, using  
623 three 56-bit keys. Two variations of TDEA have been defined: two-key TDEA (2TDEA), in  
624 which the first and third keys are identical, and three-key TDEA, in which the three keys are all  
625 different (i.e., distinct).

626 The use of two-key TDEA will no longer be approved for applying cryptographic protection  
627 (e.g., encryption) after December 31, 2015 (see [\[SP800-131A\]](#)); however, two-key TDEA may  
628 continue to be used for processing already-protected information (e.g., decryption).

651 **4.2.2.3 Modes of Operation**

652 With a block-cipher encryption operation, the same plaintext block will always encrypt to the  
653 same ciphertext block whenever the same key is used. If the multiple blocks in a typical  
654 message are encrypted separately, an adversary can easily substitute individual blocks, possibly  
655 without detection. Furthermore, certain kinds of data patterns in the plaintext, such as repeated  
656 blocks, are apparent in the ciphertext.

657 Cryptographic modes of operation have been defined to alleviate this problem by combining  
658 the basic cryptographic algorithm with variable initialization vectors and some sort of feedback  
659 of the information derived from the cryptographic operation. The NIST Recommendation for  
660 Block Cipher Modes of Operation [SP800-38A] defines modes of operation for the encryption  
661 and decryption of data using block cipher algorithms, such as AES and TDEA. Other modes  
662 **approved** for encryption are specified in other parts of [SP800-38]; some of these modes also  
663 produce message authentication codes (see Section 4.2.3). Guidance on the secure use of each  
664 mode is provided for each mode in addition to the mode specification.

Deleted: [SP800-38A]

Deleted: [SP800-38];

Deleted: Section 4.2.3).

665 Note that one of the modes included in [SP800-38A] is the ECB mode. This mode is not  
666 recommended for general use, as the ciphertext leaks information about plaintext after  
667 relatively small amounts of data are encrypted.

668 **4.2.3 Message Authentication Codes (MACs)**

669 Message Authentication Codes (MACs) can be used to provide source and integrity  
670 authentication. A MAC is a cryptographic checksum on the data that is used in order to provide  
671 assurance that the data has not changed and that the MAC was computed by the expected  
672 entity. Although message (i.e., data) integrity is often provided using non-cryptographic  
673 techniques known as error detection codes, these codes can be altered by an adversary to effect  
674 an action to the adversary's benefit. The use of an **approved** cryptographic mechanism, such  
675 as a MAC, can alleviate this problem. In addition, the MAC can provide a recipient with  
676 assurance that the originator (i.e., the source) of the data is a key holder (i.e., an entity  
677 authorized to have the key). MACs are often used to authenticate the originator to the recipient  
678 when only those two parties share the MAC key.

Deleted: data

Deleted: and integrity

679 The computation of a MAC requires the use of (1) a secret key that is known only by the party  
680 that generates the MAC and by the intended recipient(s) of the MAC, and (2) the data on which  
681 the MAC is calculated. The result of the MAC computation is often called a MacTag when  
682 transmitted; a MacTag is either a full-length or truncated result from the MAC computation.  
683 Two types of algorithms for computing a MAC have been **approved**: MAC algorithms that are  
684 based on block cipher algorithms, and MAC algorithms that are based on hash functions.

Deleted: the

685 **4.2.3.1 MACs Using Block Cipher Algorithms**

686 [SP800-38B] defines a mode to compute a MAC using **approved** block cipher algorithms,  
687 such as AES and TDEA. The key and block size used to compute the MAC depend on the  
688 algorithm used. If the same block cipher is used for both encryption and MAC computation in  
689 two separate cryptographic operations (i.e., using an encryption mode from [SP800-38A] and a  
690 MAC computed as specified in [SP800-38B]), then the same key **shall not** be used for both the

709 **4.2.4 Digital Signature Algorithms**

710 Digital signatures are used to provide [source authentication](#), integrity [authentication](#) and  
711 [support non-repudiation](#). Digital signatures are used in conjunction with hash functions and are  
712 computed on data of any length (up to a limit that is determined by the hash function).  
713 [\[FIPS186\]](#) specifies algorithms that are **approved** for the computation of digital signatures<sup>7</sup>. It  
714 defines the Digital Signature Algorithm (DSA) and adopts the RSA algorithm, as specified in  
715 [\[ANSX9.31\]](#) and [\[PKCS#1\]](#) (version 1.5 and higher), and the ECDSA algorithm, as specified  
716 in [\[ANSX9.62\]](#).

Deleted: [FIPS186]

Deleted: [ANSX9.31]

Deleted: [PKCS#1]

Deleted: [ANSX9.62].

717 [\[FIPS186\]](#) also specifies several approved key sizes for each of these algorithms, and includes  
718 [methods for generating the algorithm's key pairs and any other parameters needed for digital](#)  
719 [signature generation and verification](#). Note that older systems (legacy systems) used smaller  
720 [key sizes than those currently provided in \[FIPS186\]](#). Digital signature generation shall be  
721 [performed using keys that meet or exceed the key sizes specified in \[FIPS186\] and using key](#)  
722 [pairs that are generated in accordance with \[FIPS186\]](#). Smaller key sizes shall only be used to  
723 [verify signatures that were generated using those smaller keys](#). See [\[SP800-131A\]](#).

Deleted: 4.2.4.1 DSA¶

The Digital Signature Algorithm (DSA) is specified in [FIPS186] for specific key sizes<sup>8</sup>: 1024, 2048, and 3072 bits. The DSA will produce digital signatures of 320, 448, or 512 bits<sup>9</sup>. Older systems (legacy systems) used smaller key sizes. While it may be appropriate to continue to verify and honor signatures created using these smaller key sizes<sup>10</sup>, new signatures **shall not** be created using these key sizes. ¶

4.2.4.2. RSA¶

The RSA algorithm, as specified in [ANSX9.31] and [PKCS#1] (version 1.5 and higher) is adopted for the computation of digital signatures in [FIPS186]. [FIPS186] specifies methods for generating RSA key pairs for several key sizes for [ANSX9.31] and [PKCS#1] implementations. Older systems (legacy systems) used smaller key sizes. While it may be appropriate to continue to verify and honor signatures created using these smaller key sizes<sup>11</sup>, new signatures **shall not** be created using these key sizes. ¶

4.2.4.3 ECDSA¶

The Elliptic Curve Digital Signature Algorithm (ECDSA), as specified in [ANSX9.62], is adopted for the computation of digital signatures in [FIPS186]. [ANSX9.62] specifies a minimum key size<sup>12</sup> of 160 bits. ECDSA produces digital signatures that are twice the length of the key size. Recommended elliptic curves are provided in [FIPS186]. ¶

724 **4.2.5 Key Establishment Schemes**

725 Automated key-establishment schemes are used to set up keys to be used between  
726 communicating entities. Two types of automated key-establishment schemes are defined: key  
727 transport and key agreement. **Approved** key-establishment schemes are provided in [\[SP800-56A\]](#)  
728 and [\[SP800-56B\]](#).

729 Key transport is the distribution of a key (and other keying material) from one entity ([the](#)  
730 [sender](#)) to another entity ([the receiver](#)). The keying material is encrypted by the sending entity  
731 and decrypted by the receiving entity(ies). If a symmetric algorithm (e.g., AES) is used to  
732 [transport a key, the algorithm is used to wrap \(i.e., encrypt\) the keying material to be](#)  
733 [distributed](#); the sending and receiving entities need to know the symmetric key-wrapping key  
734 (i.e., the key-encrypting key). [See Section 4.2.5.4 for further discussion on key encryption and](#)  
735 [key wrapping](#).

<sup>6</sup> See the caveat regarding source authentication in Section 4.2.3 above.

<sup>7</sup> Two general types of digital signature methods are discussed in literature: digital signatures with appendix, and digital signatures with message recovery. [\[FIPS186\]](#) specifies algorithms for digital signatures with appendix, and is the digital signature method that is discussed in this Recommendation.

784 If a public-key algorithm is used for key transport, one key of a key pair is used to encrypt the  
 785 key to be established, and the other key is used for decryption. In this case, the sending entity  
 786 encrypts the keying material using the receiving entity's public key, and the receiving entity  
 787 decrypts the received keying material using the associated private key.

**Deleted:** to distribute the keying material,  
**Deleted:** as  
**Deleted:** key-encrypting key;  
**Deleted:** :  
**Deleted:** (i.e., the sending and receiving entities)

788 Key agreement is the participation by both entities in the creation of shared keying material.  
 789 This may be accomplished using either asymmetric (public-key) or symmetric-key techniques.  
 790 If an asymmetric algorithm is used, each entity has either a static key pair or an ephemeral key  
 791 pair or both. If a symmetric-key algorithm is used, each entity shares the same symmetric key-  
 792 wrapping key.

793 **4.2.5.1 Discrete Log Key Agreement Schemes**

**Deleted:** [SP800-56A]

794 [SP800-56A] specifies key-establishment schemes that use discrete-logarithm-based public-  
 795 key algorithms. These schemes are specified using either finite-field math (the form of math  
 796 that most of us use) or elliptic curve math.

797 With the key-establishment schemes specified in [SP800-56A], a party may own and use an  
 798 ephemeral key, a static key, or both an ephemeral and a static key in a single key-agreement  
 799 transaction. The ephemeral key is used to provide a new secret for each key-establishment  
 800 transaction, while the static key (if used in a PKI with public-key certificates) provides for the  
 801 authentication of the owner.

**Deleted:** [SP800-56A] characterizes each scheme into a class, depending upon how many ephemeral and static keys are used. Each scheme class has its corresponding security properties.

802 [SP800-56A] also provides a key-confirmation method for most of its schemes to obtain  
 803 assurance that each party has agreed upon the same keying material (see Section 4.2.5.5 for a  
 804 discussion of key confirmation).

**Deleted:** 56B]  
**Deleted:** .

805 **4.2.5.2 Key Establishment Using Integer-Factorization Schemes**

**Deleted:** In these schemes, one party always owns a key pair, and the other party may or may not own a key pair, depending on the scheme. In these schemes, only static keys are used; ephemeral keys are not used

806 [SP800-56B] provides key-establishment schemes that use integer-factorization-based public-  
 807 key algorithms, (e.g., RSA). Two of the families of schemes specified in [SP800-56B] provide  
 808 for key agreement, and the other two families provide for key transport. Each scheme family  
 809 has a basic scheme and one or more schemes that provide key confirmation.

**Deleted:** [SP800-56B)].

810 In these schemes, one party always owns and uses a key pair, and the other party may or may  
 811 not use a key pair, depending on the scheme. Only static keys are used in the [SP800-56B]  
 812 schemes; ephemeral keys are not used.

**Deleted:** use  
**Deleted:** .

813 **4.2.5.3 Security Properties of the Key-Establishment Schemes**

**Deleted:** 4.2.5.1 Discrete Log Key Agreement Schemes Using Finite Field Arithmetic¶  
 Key agreement schemes based on the intractability of the discrete-logarithm problem and using finite-field arithmetic have been specified in [SP800-56A]. Each scheme provides a different configuration of required key pairs that may be used, depending on the requirements of a communication situation.¶  
 4.2.5.2 Discrete Log Key Agreement Schemes Using Elliptic Curve Arithmetic ¶  
 Key agreement schemes based on the intractability of the discrete-logarithm problem and using elliptic-curve arithmetic have been specified in [SP800-56A]. Each scheme provides a different configuration of required key pairs that may be used, depending on the requirements of a communication situation.¶  
 4.2.5.3 RSA Key Establishment¶  
 RSA key-establishment schemes based on the integer-factorization problem have been approved in [SP800-56B]. Four scheme families are specified, two families for key agreement and two for key transport. Each scheme family has a basic scheme and one or more key confirmation schemes.¶  
 4.2.5.4 .

814 Cryptographic protocol designers need to understand the security properties of the schemes in  
 815 order to assure that the desired capabilities are available to the user. In general, schemes where  
 816 each party uses both an ephemeral and a static key provide more security properties than  
 817 schemes using fewer keys. However, it may not be practical for both parties to use both static  
 818 and ephemeral keys in certain applications, and the use of ephemeral keys is not specified for  
 819 all algorithms (see [SP800-56B]). For example, in email applications, it is desirable to send  
 820 messages to other parties who are not on-line. In this case, the receiver cannot be expected to  
 821 provide an ephemeral key to establish the message-encrypting key during a [SP800-56A] key-  
 822 agreement scheme.

823 Both [SP80056A] and [SP800-56B] include discussions of the security properties of each of its  
 824 schemes.

870 **4.2.5.4 Key Encryption and Key Wrapping**

871 Key encryption provides confidentiality protection for a key by encrypting that key using a  
872 key-encrypting key; decryption reverses the process using the same key. Key wrapping  
873 provides both confidentiality and integrity protection for a key using a key-wrapping key to  
874 both encrypt and integrity protect the key to be protected; key unwrapping decrypts the  
875 ciphertext key and verifies its integrity. Although the key-protection services are slightly  
876 different and use different methods, the keys are generated in the same manner. In this  
877 Recommendation and elsewhere, the terms<sup>13</sup> are often used interchangeably.

878 Both processes use a symmetric algorithm, such as AES. Several methods for key wrapping  
879 have been specified or referenced in [SP800-38F].

880 **4.2.5.5 Key Confirmation**

881 Key confirmation is used by two parties in a key-establishment process to provide assurance  
882 that common keying material and/or a shared secret<sup>14</sup> has been established. The assurance may  
883 be provided to only one party (unilateral) or it may be provided to both parties (bilateral). The  
884 assurance may be provided as part of the key-establishment scheme, or it may be provided by  
885 some action that takes place outside of the scheme. For example, after a key is established, two  
886 parties may provide assurance (i.e., a confirmation) to one another that they possess the same  
887 key by demonstrating their ability to encrypt and decrypt data intended for each other.

888 [SP800-56A] provides for unilateral key confirmation for schemes where one party has a static  
889 key-establishment key, and bilateral key confirmation for schemes where both parties have  
890 static key-establishment keys. A total of ten key-confirmation schemes are provided, seven of  
891 which are unilateral, and three of which are bilateral.

892 [SP800-56B] provides for unilateral key confirmation from the responder, in the case of a key  
893 agreement scheme, and from the receiver, in the case of a key-transport scheme. Initiator and  
894 bilateral key confirmation are also provided for one family of key-agreement schemes.

895 **4.2.6 Key Establishment Protocols**

896 Key establishment protocols use key-establishment schemes in order to specify the processing  
897 necessary to establish a key. However, key-establishment protocols also specify message flow  
898 and format. Key-establishment protocols need to be carefully designed to not give secret  
899 information to a potential attacker. For example, a protocol that indicates abnormal conditions,  
900 such as an integrity error, may permit an attacker to confirm or reject an assumption regarding  
901 secret data. Alternatively, if the time or power required to perform certain computations are  
902 based upon the value of the secret or private key in use, then an attacker may be able to deduce  
903 the key from observed fluctuations.

904 Therefore, it is best to design key-establishment protocols so that:

- 905 1. The protocols do not provide for an early exit from the protocol upon detection of a  
906 single error,

- 923 conditions, and
- 924 3. The key-dependent computations are obscured from the observer in order to prevent or
- 925 minimize the detection of key-dependent characteristics.

926 **4.2.7 Random Bit Generation**

927 Random bit generators (RBGs) (also called random number generators (RNGs)) are required  
928 for the generation of keying material (e.g., keys and IVs). RBGs generate sequences of random  
929 bits (e.g., 010011); technically, RNGs translate those bits into numbers (e.g., 010011 is  
930 translated into the number 19). However, the use of the term “random number generator”  
931 (RNG) is commonly used to refer to both concepts.

932 Two classes of RBGs are defined: deterministic and non-deterministic. Deterministic Random  
933 Bit Generators (DRBGs), sometimes called deterministic random number generators or  
934 pseudorandom number generators, use cryptographic algorithms and the associated keying  
935 material to generate pseudorandom bits from an initial value, called a seed, that provides  
936 entropy (i.e., randomness) to the process. Depending on the implemented DRBG design or the  
937 environment, additional entropy never be introduced again, although such additional entropy is  
938 recommended. [SP800-90A] specifies DRBG algorithms that may be used to generate random  
939 bits for cryptographic applications (e.g., key or IV generation).

940 Non-deterministic Random Bit Generators (NRBGs), sometimes called true RNGs, use some  
941 unpredictable physical source that is outside human control to introduce new entropy for every  
942 bit output by the NRBG. The unpredictable source is commonly known as an entropy source.  
943 [SP800-90B] provides guidance on the implementation and testing of entropy sources.

944 [SP800-90C] has been developed to provide guidance on the construction of DRBGs and  
945 NRBGs from the algorithms in [SP800-90A] and entropy sources that comply with [SP800-  
946 90B].

**Deleted:** Number

**Deleted:** and

**Deleted:** )

**Deleted:** , and will be used interchangeably with “RBG” in this document.

**Deleted:** random bits; Non-deterministic Random Bit Generators (NRBGs), sometimes called true RNGs, produce output that is dependent on some unpredictable physical source that is outside human control. ¶ [SP800-90A] specifies DRBGs

**Deleted:** key or IV generation). A DRBG is initialized with a secret starting value, called a seed. An “attacker” with knowledge of the DRBG output should not be able to determine the seed other than by exhaustive guessing.

947 **5 GENERAL KEY MANAGEMENT GUIDANCE**

948 This section classifies the different types of keys and other cryptographic information  
949 according to their uses; discusses cryptoperiods and recommends appropriate cryptoperiods for  
950 each key type; provides recommendations and requirements for other keying material;  
951 introduces assurance of domain-parameter validity, public-key validity, and private-key  
952 possession; discusses the implications of the compromise of keying material; and provides  
953 guidance on the selection, implementation, and replacement of cryptographic algorithms and  
954 key sizes according to their security strengths.

955 **5.1 Key Types and Other Information**

956 There are several different types of cryptographic keys, each used for a different purpose. In  
957 addition, there is other information that is specifically related to cryptographic algorithms and  
958 keys.

959 **5.1.1 Cryptographic Keys**

960 Several different types of keys are defined. The keys are identified according to their  
961 classification as public, private or symmetric keys, and as to their use. For public and private

978 key-agreement keys, their status as static or ephemeral keys is also specified. See [Table 5 in](#)  
979 [Section 6.1.1](#) for the required protections for each type of information.

**Deleted:** Table 5 in Section 6.1.1

980 1. *Private signature key:* Private signature keys are the private keys of asymmetric  
981 (public) key pairs that are used by public-key algorithms to generate digital signatures  
982 with possible long-term implications. When properly handled, private signature keys  
983 can be used to provide source authentication, integrity, [authentication](#) and [support the](#)  
984 non-repudiation of messages, documents or stored data.

1012 9. *Symmetric master key:* A symmetric master key is used to derive other symmetric keys  
1013 (e.g., data-encryption keys, key-wrapping keys, or [source](#) authentication keys) using  
1014 symmetric cryptographic methods. The master key is also known as a key-derivation  
1015 key.

<sup>15</sup> While integrity protection is also provided, it is not the primary intention of this key.

<sup>16</sup> While integrity protection is also provided, it is not the primary intention of this key.

- 1034 10. *Private key-transport key*: Private key-transport keys are the private keys of asymmetric  
 1035 (public) key pairs that are used to decrypt keys that have been encrypted with the  
 1036 [corresponding](#) public key using a public-key algorithm. Key-transport keys are usually  
 1037 used to establish keys (e.g., key-wrapping keys, data-encryption keys or MAC keys)  
 1038 and, optionally, other keying material (e.g., Initialization Vectors).
- 1039 11. *Public key-transport key*: Public key-transport keys are the public keys of asymmetric  
 1040 (public) key pairs that are used to encrypt keys using a public-key algorithm. These  
 1041 keys are used to establish keys (e.g., key-wrapping keys, data-encryption keys or MAC  
 1042 keys) and, optionally, other keying material (e.g., Initialization Vectors). [The encrypted  
 1043 form of the established key might be stored for later decryption using the private key-  
 1044 transport key.](#)
- 1045 12. *Symmetric key-agreement key*: These symmetric keys are used to establish keys (e.g.,  
 1046 key-wrapping keys, data-encryption keys, or MAC keys) and, optionally, other keying  
 1047 material (e.g., Initialization Vectors) using a symmetric key-agreement algorithm.
- 1048 13. *Private static key-agreement key*: Private static key-agreement keys are the [long-term](#)  
 1049 private keys of asymmetric (public) key pairs that are used to establish keys (e.g., key-  
 1050 wrapping keys, data-encryption keys, or MAC keys) and, optionally, other keying  
 1051 material (e.g., Initialization Vectors).
- 1052 14. *Public static key-agreement key*: Public static key-agreement keys are the [long-term](#)  
 1053 public keys of asymmetric (public) key pairs that are used to establish keys (e.g., key-  
 1054 wrapping keys, data-encryption keys, or MAC keys) and, optionally, other keying  
 1055 material (e.g., Initialization Vectors).
- 1056 15. *Private ephemeral key-agreement key*: Private ephemeral key-agreement keys are the  
 1057 [short-term](#) private keys of asymmetric (public) key pairs that are used only once<sup>17</sup> to  
 1058 establish one or more keys (e.g., key-wrapping keys, data-encryption keys, or MAC  
 1059 keys) and, optionally, other keying material (e.g., Initialization Vectors).
- 1060 16. *Public ephemeral key-agreement key*: Public ephemeral key-agreement keys are the  
 1061 [short-term](#) public keys of asymmetric key pairs that are used in a single key-  
 1062 establishment transaction<sup>18</sup> to establish one or more keys (e.g., key-wrapping keys,  
 1063 data-encryption keys, or MAC keys) and, optionally, other keying material (e.g.,  
 1064 Initialization Vectors).
- 1065 17. *Symmetric authorization key*: Symmetric authorization keys are used to provide  
 1066 privileges to an entity using a symmetric cryptographic method. The authorization key  
 1067 is known by the entity responsible for monitoring and granting access privileges for  
 1068 authorized entities and by the entity seeking access to resources.
- 1069 18. *Private authorization key*: A private authorization key is the private key of an  
 1070 asymmetric (public) key pair that is used to provide privileges to an entity.

Deleted: associated

<sup>17</sup> In some cases ephemeral keys are used more than once, though within a single “session”. For example, when Diffie-Hellman is used in S/MIME CMS, the sender may generate one ephemeral key pair per message, and combine the private key separately with each recipient’s public key.

<sup>18</sup> The public ephemeral key-agreement key of a sender may be retained by the receiver for later use in decrypting a stored (encrypted) message for which the ephemeral key pair was generated.

Deleted: is combined

1072 19. *Public authorization key*: A public authorization key is the public key of an asymmetric  
1073 (public) key pair that is used to verify privileges for an entity that knows the associated  
1074 private authorization key.

1075 **5.1.2 Other Cryptographic or Related Information**

1076 Other information used in conjunction with cryptographic algorithms and keys also needs to be  
1077 protected. See [Table 6 in Section 6.1.2](#), for the required protections for each type of  
1078 information.

Deleted: Table 6 in Section 6.1.2

1079 1. *Domain Parameters*: Domain parameters are used in conjunction with some public-key  
1080 algorithms to generate key pairs, to create digital signatures or to establish keying material.

1081 2. *Initialization Vectors*: Initialization vectors (IVs) are used by several modes of operation  
1082 for encryption and decryption (see [Section 4.2.2.3](#)) and for the computation of MACs using  
1083 block cipher algorithms (see [Section 4.2.3.1](#)).

Deleted: Section 4.2.2.3)

Deleted: Section 4.2.3.1)

1084 3. *Shared Secrets*: Shared secrets are generated during a key-[agreement](#) process as defined in  
1085 [\[SP800-56A\]](#) and [\[SP800-56B\]](#). Shared secrets **shall** be protected and handled in the same  
1086 manner as cryptographic keys. If a FIPS 140-validated cryptographic module is being used,  
1087 then the protection of the shared secrets is provided by the cryptographic module.

Deleted: establishment

Deleted: [SP800-56A]

Deleted: [SP800-56B].

1088 4. *RBG seeds*: [RBG](#) seeds are used in the generation of *deterministic random bits* (e.g., used  
1089 to generate keying material that must remain secret or private).

Deleted: RNG

Deleted: RNG

Deleted: numbers

1090 5. *Other public information*: Public information (e.g., a nonce) is often used in the key-  
1091 establishment process.

1092 6. *Other secret information*: Secret information may be included in the seeding of an [RBG](#) or  
1093 in the establishment of keying material.

Deleted: RNG

1094 7. *Intermediate Results*: The intermediate results of cryptographic operations using secret  
1095 information must be protected. Intermediate results **shall not** be available for purposes  
1096 other than as intended.

1097 8. *Key-control information*: Information related to the keying material (e.g., the identifier,  
1098 purpose, or a counter) must be protected to ensure that the associated keying material can  
1099 be correctly used. The key-control information is included in the metadata associated with  
1100 the key (see [Section 6.2.3.1](#)).

Deleted: Section 6.2.3.1).

1101 9. *Random numbers (or bits)*: The random numbers created by a random [bit](#) generator **should**  
1102 be protected when retained. When used directly as keying material [or in its generation](#), the  
1103 random [bits](#) **shall** be protected as discussed in [Section 6](#).

Deleted: :

Deleted: number

Deleted: numbers

1104 10. *Passwords*: A password is used to acquire access to privileges and can be used as a  
1105 credential in [a source](#) authentication mechanism. A password can also be used to derive  
1106 cryptographic keys that are used to protect and access data in storage, as specified in  
1107 [\[SP800-132\]](#).

Deleted: Section 6.

Deleted: an

Deleted: [SP800-132].

1108 11. *Audit information*: Audit information contains a record of key-management events.

1126 **5.2 Key Usage**

1127 In general, a single key **shall** be used for only one purpose (e.g., encryption, [integrity](#)  
1128 authentication, key wrapping, random [bit](#) generation, or digital signatures). There are several  
1129 reasons for this:

**Deleted:** should  
**Deleted:** number

- 1130 1. The use of the same key for two different cryptographic processes may weaken the  
1131 security provided by one or both of the processes.
- 1132 2. Limiting the use of a key limits the damage that could be done if the key is  
1133 compromised.
- 1134 3. Some uses of keys interfere with each other. For example, consider a key pair used for  
1135 both key transport and digital signatures. In this case, the private key is used as both a  
1136 private key-transport key to decrypt [the encrypted](#) keys and [as](#) a private signature key to  
1137 apply digital signatures. It may be necessary to retain the private key-transport key  
1138 beyond the cryptoperiod of the corresponding public key-transport key in order to  
1139 decrypt the [encrypted](#) keys needed to access encrypted data. On the other hand, the  
1140 private signature key **shall** be destroyed at the expiration of its cryptoperiod to prevent  
1141 its compromise (see [Section 5.3.6](#)). In this example, the longevity requirements for the  
1142 private key-transport key and the private digital-signature key contradict each other.

**Deleted:** data-encryption  
**Deleted:** data-encryption  
**Deleted:** Section 5.3.6).

1143 This principle does not preclude using a single key in cases where the same process can  
1144 provide multiple services. This is the case, for example, when a digital signature provides  
1145 [integrity authentication and](#) source authentication using a single digital signature, or when a  
1146 single symmetric key can be used to encrypt and authenticate data in a single cryptographic  
1147 operation (e.g., using an authenticated-encryption operation, as opposed to separate encryption  
1148 and authentication operations). Also, refer to [Section 3.7](#).

**Deleted:** assurance of the identity of the  
originating entity, non-repudiation,  
**Deleted:** and integrity protection  
**Deleted:** data-encryption  
**Deleted:** Section 3.7.  
**Deleted:** also

1149 This Recommendation permits the use of a private key-transport or key-agreement key to  
1150 generate a digital signature for the following special case:

1151 When requesting the (initial) certificate for a static key-establishment key, the  
1152 [corresponding](#) private key may be used to sign the certificate request. Also refer to [Section](#)  
1153 [8.1.5.1.1.2](#).

**Deleted:** associated  
**Deleted:** Section 8.1.5.1.1.2.

1154 **5.3 Cryptoperiods**

1155 A cryptoperiod is the time span during which a specific key is authorized for use by legitimate  
1156 entities, or the keys for a given system will remain in effect. A suitably defined cryptoperiod:

- 1157 1. Limits the amount of information protected by a given key that is available for  
1158 cryptanalysis,
- 1159 2. Limits the amount of exposure if a single key is compromised,
- 1160 3. Limits the use of a particular algorithm to its estimated effective lifetime,
- 1161 4. Limits the time available for attempts to penetrate physical, procedural, and logical  
1162 access mechanisms that protect a key from unauthorized disclosure,
- 1163 5. Limits the period within which information may be compromised by inadvertent  
1164 disclosure of keying material to unauthorized entities, and

1178 6. Limits the time available for computationally intensive cryptanalytic attacks (in  
1179 applications where long-term key protection is not required).

1180 Sometimes cryptoperiods are defined by an arbitrary time period or maximum amount of data  
1181 protected by the key. However, trade-offs associated with the determination of cryptoperiods  
1182 involve the risk and consequences of exposure, which should be carefully considered when  
1183 selecting the cryptoperiod (see [Section 5.6.4](#)).

Deleted: Section 5.6.4).

### 1184 5.3.1 Risk Factors Affecting Cryptoperiods

1185 Among the factors affecting the [length of a cryptoperiod](#) are:

Deleted: risk

Deleted: exposure

1186 1. The strength of the cryptographic mechanisms (e.g., the algorithm, key length, block  
1187 size, and mode of operation),

1188 2. The embodiment of the mechanisms (e.g., a [FIPS140](#) Level 4 implementation or a  
1189 software implementation on a personal computer),

Deleted: [FIPS140]

1190 3. The operating environment (e.g., a secure limited-access facility, open office  
1191 environment, or publicly accessible terminal),

1192 4. The volume of information flow or the number of transactions,

1193 5. The security life of the data,

1194 6. The security function (e.g., data encryption, digital signature, key derivation, [or](#) key  
1195 protection),

Deleted: production or

1196 7. The re-keying method (e.g., keyboard entry, re-keying using a key loading device  
1197 where humans have no direct access to key information, [or](#) remote re-keying within a  
1198 PKI),

1199 8. The key update or key-derivation process,

1200 9. The number of nodes in a network that share a common key,

1201 10. The number of copies of a key and the distribution of those copies,

1202 11. Personnel turnover (e.g., CA system personnel), and

1203 12. The threat to the information [from adversaries](#) (e.g., whom the information is protected  
1204 from, and what are their perceived technical capabilities and financial resources to  
1205 mount an attack).

1206 [13. The threat to the information from new and disruptive technologies \(e.g., quantum  
1207 computers\).](#)

1208 In general, short cryptoperiods enhance security. For example, some cryptographic algorithms  
1209 might be less vulnerable to cryptanalysis if the adversary has only a limited amount of  
1210 information encrypted under a single key. On the other hand, where manual key-distribution  
1211 methods are subject to human error and frailty, more frequent key changes might actually  
1212 increase the risk of [key](#) exposure. In these cases, especially when very strong cryptography is  
1213 employed, it may be more prudent to have fewer, well-controlled manual key distributions,  
1214 rather than more frequent, poorly controlled manual key distributions.

1215 In general, where strong cryptography is employed, physical, procedural, and logical access-  
1216 protection considerations often have more impact on cryptoperiod selection than do algorithm

1222 and key-size factors. In the case of **approved** algorithms, modes of operation, and key sizes,  
1223 adversaries may be able to access keys through [the](#) penetration or subversion of a system with  
1224 less expenditure of time and resources than would be required to mount and execute a  
1225 cryptographic attack.

1226 **5.3.2 Consequence Factors Affecting Cryptoperiods**

1227 The consequences of exposure are measured by the sensitivity of the information, the criticality  
1228 of the processes protected by the cryptography, and the cost of recovery from the compromise  
1229 of the information or processes. Sensitivity refers to the lifespan of the information being  
1230 protected (e.g., 10 minutes, 10 days or 10 years) and the potential consequences of a loss of  
1231 protection for that information (e.g., the disclosure of the information to unauthorized entities).  
1232 In general, as the sensitivity of the information or the criticality of the processes protected by  
1233 cryptography increase, the length of the associated cryptoperiods **should** decrease in order to  
1234 limit the damage that might result from each compromise. This is subject to the caveat  
1235 regarding the security and integrity of the re-keying, key update or key-derivation process (see  
1236 Sections [8.2.3](#) and [8.2.4](#)). Short cryptoperiods may be counter productive, particularly where  
1237 denial of service is the paramount concern, and there is a significant potential for error in the  
1238 re-keying, key update or key-derivation process.

**Deleted:** 8.2.3  
**Deleted:** 8.2.4).

1239 **5.3.3 Other Factors Affecting Cryptoperiods**

1240 **5.3.3.1 Communications versus Storage**

1241 Keys that are used for confidentiality protection of [communication](#) exchanges may often have  
1242 shorter cryptoperiods than keys used for the protection of stored data. Cryptoperiods are  
1243 generally made longer for stored data because the overhead of re-encryption associated with  
1244 changing keys may be burdensome.

**Deleted:** communications

1245 **5.3.3.2 Cost of Key Revocation and Replacement**

1246 In some cases, the costs associated with changing keys are painfully high. Examples include  
1247 decryption and subsequent re-encryption of very large databases, decryption and re-encryption  
1248 of distributed databases, and revocation and replacement of a very large number of keys (e.g.,  
1249 where there are very large numbers of geographically and organizationally distributed key  
1250 holders). In such cases, the expense of the security measures necessary to support longer  
1251 cryptoperiods may be justified (e.g., costly and inconvenient physical, procedural, and logical  
1252 access security; and the use of cryptography strong enough to support longer cryptoperiods,  
1253 even where this may result in significant additional processing overhead). In other cases, the  
1254 cryptoperiod may be shorter than would otherwise be necessary; for example, keys may be  
1255 changed frequently in order to limit the period of time that the key management system  
1256 maintains status information.

**Deleted:** for Asymmetric Keys  
**Deleted:** That is, each  
**Deleted:** by an "originator"  
**Deleted:** ) or by a "recipient" to subsequently  
**Deleted:** ), but not both. Where public keys are distributed in public-key certificates, the cryptoperiod for each key of the key pair is not necessarily  
**Deleted:** as the validity period of  
**Deleted:** certificate. The cryptoperiod of a public key is extended  
**Deleted:** expiration date of a certificate when a new public-key certificate with the same subject public key and a later expiration date is issued.

1257 **5.3.4 Asymmetric Key Usage Periods and Cryptoperiods**

1258 For key pairs, each key of the pair has its own cryptoperiod. [One key of the key pair is used to](#)  
1259 [apply cryptographic protection \(e.g., create a digital signature\), and its cryptoperiod can be](#)  
1260 [considered as an "originator-usage period." The other key of the key pair is used to process the](#)  
1261 [protected information \(e.g., verify a digital signature\); its cryptoperiod is considered to be the](#)  
1262 ["recipient-usage period." The key pair's originator and recipient-usage periods typically begin](#)  
1263 [at the same time, but the recipient-usage period may extend beyond the originator-usage](#)  
1264 [period. For example:](#)

1282 • In the case of digital signature key pairs, the private signature key is used to sign data  
1283 (i.e., apply cryptographic protection), so its cryptoperiod is considered to be an  
1284 originator-usage period. The public signature-verification key is used to verify digital  
1285 signatures (i.e., process already-protected information); its cryptoperiod is considered  
1286 to be a recipient-usage period.

1287 For a private signature key that is used to generate digital signatures as a proof-of-  
1288 origin (i.e., for source authentication), the originator-usage period (i.e., the period  
1289 during which the private key may be used to generate signatures) is often shorter than  
1290 the recipient-usage period (i.e., the period during which the signature may be verified).  
1291 In this case, the private key is intended for use for a fixed period of time, after which  
1292 time the key owner **shall** destroy<sup>19</sup> the private key. The public key may be available for  
1293 a longer period of time for verifying signatures.

1294 The cryptoperiod of a private source-authentication key that is used to sign challenge  
1295 information is basically the same as the cryptoperiod of the associated public key (i.e.,  
1296 the public source-authentication key). That is, when the private key will not be used to  
1297 sign challenges, the public key is no longer needed. In this case, the originator and  
1298 recipient-usage periods are the same.

1299 • For key transport keys, the public key-transport key is used to apply protection (i.e.,  
1300 encrypt), so its cryptoperiod would be considered as an originator-usage period; the  
1301 private key-transport key is used to decrypt, so its cryptoperiod would be considered as  
1302 the recipient-usage period. The originator-usage period (i.e., the period during which  
1303 the public key may be used for encryption) is often shorter than the recipient-usage  
1304 period (i.e., the period during which the encrypted information may be decrypted).

1305 • For key-agreement algorithms, the cryptoperiods of the two keys of the key pair are  
1306 usually the same.

1307 Where public keys are distributed in public-key certificates, each certificate has a validity  
1308 period, indicated by the *notBefore* and *notAfter* dates in the certificate. Certificates may be  
1309 renewed, i.e., a new certificate containing the same public key may be issued with a new  
1310 validity period. The sum of the validity periods for the original certificate and all renewed  
1311 certificates for the same public key **shall not** exceed the cryptoperiod of the key of the key pair  
1312 used to apply protection (i.e., the key with the originator-usage period).

1313 See Section 5.3.6 for guidance regarding specific key types.

### 1314 5.3.5 Symmetric Key Usage Periods and Cryptoperiods

1315 For symmetric keys, a single key is used for both applying the protection (e.g., encrypting or  
1316 computing a MAC) and processing the protected information (e.g., decrypting the encrypted  
1317 information or verifying a MAC). The period of time during which cryptographic protection  
1318 may be applied to data is called the *originator-usage period*, and the period of time during

<sup>19</sup> A simple deletion of the keying material might not completely obliterate the information. For example, erasing the information might require overwriting that information multiple times with other non-related information, such as random bits, or all zero or one bits. Keys stored in memory for a long time can become “burned in”. This can be mitigated by splitting the key into components that are frequently updated (see [\[DiCrescenzo\]](#)).

**Deleted:** See Section 5.3.6 for guidance regarding specific key types. Examples of cryptoperiod issues associated with public-key cryptography include:  
1. The cryptoperiod of a private key-transport key may be longer than the cryptoperiod of the associated public key (i.e., the public key-transport key). The public key is used for a fixed period of time to encrypt keying material. That period of time may be indicated by the *expiration date* on a public-key certificate. The

**Deleted:** key will need to be retained as long as there is a need to recover (i.e., decrypt) the key(s) encrypted by the public key.  
2. . In contrast, the cryptoperiod of a private authentication

**Deleted:** sign challenge information is basically the same as the cryptoperiod of the associated public key (i.e., the public authentication key). That is, when the private key will not be used to sign challenges, the public key is no longer needed.  
3. If a private signature key is used to

**Deleted:** , the cryptoperiod of

**Deleted:** significantly

**Deleted:** cryptoperiod of

**Deleted:** associated public

**Deleted:** -verification key.

**Deleted:** usually

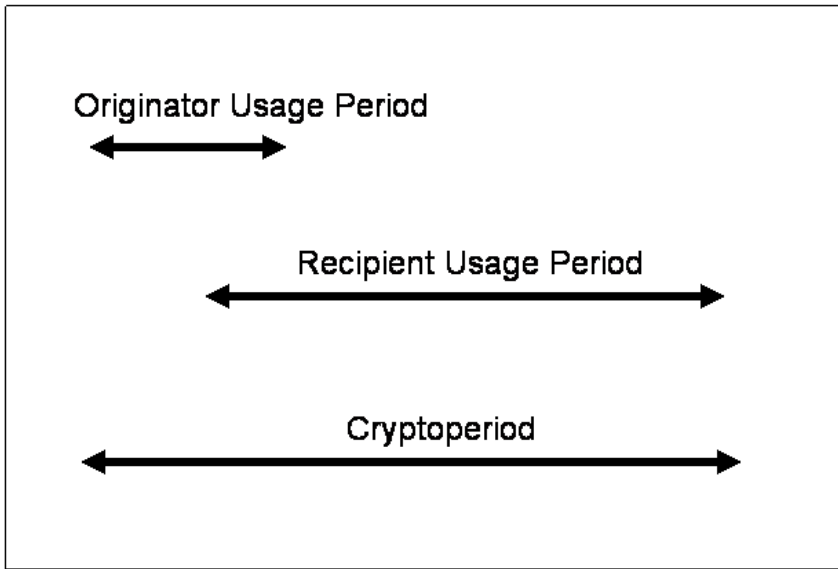

**Deleted:** However, other factors, such as the strength of the signing algorithm, the value of the signature, and the likelihood of forgery, **should** be considered.

**Deleted:** [DiCrescenzo]).

1351 which the protected information is processed is called the *recipient-usage period*. A symmetric  
 1352 key **shall not** be used to provide protection after the end of the originator-usage period. The  
 1353 recipient-usage period may extend beyond the originator-usage period (see Figure 1). This  
 1354 permits all information that has been protected by the originator to be processed by the  
 1355 recipient before the processing key is deactivated. However, in many cases, the originator and  
 1356 recipient-usage periods are the same. The (total) “cryptoperiod” of a symmetric key is the  
 1357 period of time from the beginning of the originator-usage period to the end of the recipient-  
 1358 usage period, although the originator-usage period has historically been used as the  
 1359 cryptoperiod for the key.

1360 Note that in some cases, predetermined cryptoperiods may not be adequate for the security life  
 1361 of the protected data. If the required security life exceeds the cryptoperiod, then the protection  
 1362 will need to be reapplied using a new key.

1363  
 1364 **Figure 1: Symmetric key cryptoperiod**

1365 Examples of the use of the usage periods include:

- 1366 a. When a symmetric key is used only for securing communications, the period of time  
 1367 from the originator’s application of protection to the recipient’s processing **may be**  
 1368 negligible. In this case, the key is authorized for either purpose during the entire  
 1369 cryptoperiod, i.e., the originator-usage period and the recipient-usage period are the  
 1370 same.
- 1371 b. When a symmetric key is used to protect stored information, the originator-usage  
 1372 period (when the originator applies cryptographic protection to stored information) may  
 1373 end much earlier than the recipient-usage period (when the stored information is  
 1374 processed). In this case, the cryptoperiod begins at the initial time authorized for the  
 1375 application of protection with the key, and ends with the latest time authorized for

Deleted: .

Moved (insertion) [3]

Deleted: is

1378 processing using that key. In general, the recipient-usage period for stored information  
1379 will continue beyond the originator-usage period, so that the stored information may be  
1380 authenticated or decrypted at a later time.

Deleted: .

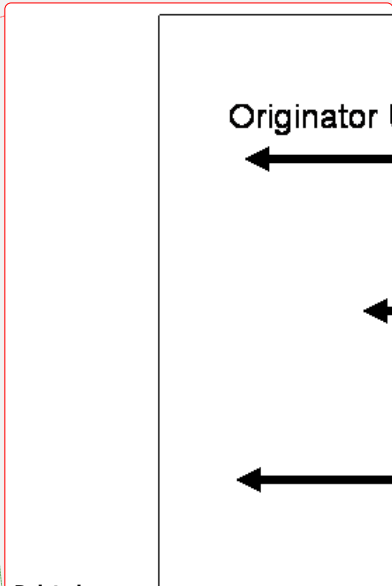

1381 c. When a symmetric key is used to protect stored information, the recipient-usage period  
1382 may start after the beginning of the originator-usage period as shown in [Figure 1](#). For  
1383 example, information may be encrypted before being stored on [some storage media](#). At  
1384 some later time, the key may be distributed in order to decrypt and recover the  
1385 information.

Deleted: Figure 1.

Deleted: a compact disk

### 1386 **5.3.6 Cryptoperiod Recommendations for Specific Key Types**

1387 The cryptoperiod required for a given key may be affected by [the](#) key type as much as by the  
1388 usage environment and data characteristics described above. Some general cryptoperiod  
1389 recommendations for various key types are suggested below. Note that the cryptoperiods  
1390 suggested are only rough order-of-magnitude guidelines; longer or shorter cryptoperiods may  
1391 be warranted, depending on the application and environment in which the keys will be used.  
1392 However, when assigning a longer cryptoperiod than that suggested below, serious  
1393 consideration should be given to the risks associated with doing so (see [Section 5.3.1](#)). Most of  
1394 the suggested cryptoperiods are on the order of 1-2 years, based on 1) a desire for maximum  
1395 operational efficiency and 2) assumptions regarding the minimum criteria for the usage  
1396 environment (see [\[FIPS140\]](#), [\[SP800-14\]](#), and [\[SP800-37\]](#)). The factors described in Sections  
1397 [5.3.1](#) through [5.3.3](#) **should** be used to determine actual cryptoperiods for specific usage  
1398 environments.

#### 1399 1. *Private signature key:*

1400 a. Type Considerations: In general, the cryptoperiod of a private signature key may be  
1401 shorter than the cryptoperiod of the corresponding public signature-verification key.  
1402 [When the corresponding public key has been certified by a CA, the cryptoperiod ends](#)  
1403 [when the \*notAfter\* date is reached on the last certificate issued for the public key](#)<sup>20</sup>.

Deleted:

Moved up [3]: Figure 1: Symmetric key cryptoperiod

Deleted: (Example C)¶

Deleted: Section 5.3.1).

Deleted: [FIPS140], [SP800-14], [SP800-21],

Deleted: [SP800-37]).

Deleted: 5.3.1

Deleted: 5.3.3

Deleted: 1-3

Deleted: associated

1404 b. Cryptoperiod: Given the use of **approved** algorithms and key sizes, and an  
1405 expectation that the security of the key-storage and use environment will increase as the  
1406 sensitivity and/or criticality of the processes for which the key provides integrity  
1407 protection increases, a maximum cryptoperiod of about [one to three](#) years is  
1408 recommended. The key **shall** be destroyed at the end of its cryptoperiod.

#### 1409 2. *Public signature-verification key:*

1410 a. Type Considerations: In general, the cryptoperiod of a public signature-verification  
1411 key may be longer than the cryptoperiod of the corresponding private signature key.  
1412 The cryptoperiod is, in effect, the period during which any signature computed using  
1413 the [corresponding](#) private signature key needs to be verified. A longer cryptoperiod for  
1414 the public signature-verification key (than the private signature key) poses a relatively  
1415 minimal security concern.

<sup>20</sup> [Multiple consecutive certificates may be issued for the same public key, presumably with different \*notBefore\* and \*notAfter\* validity dates.](#)

1431 b. Cryptoperiod: The cryptoperiod may be on the order of several years, though due to  
1432 the long exposure of protection mechanisms to hostile attack, the reliability of the  
1433 signature is reduced with the passage of time. That is, for any given algorithm and key  
1434 size, vulnerability to cryptanalysis is expected to increase with time. Although choosing  
1435 the strongest available algorithm and a large key size can minimize this vulnerability to  
1436 cryptanalysis, the consequences of exposure to attacks on physical, procedural, and  
1437 logical access-control mechanisms for the private key are not affected.

1438 Some systems use a cryptographic timestamping function to place an unforgeable  
1439 timestamp on each signed message. ~~Even though the cryptoperiod of the private~~  
1440 ~~signature key has expired, the corresponding public signature-verification key may be~~  
1441 ~~used to verify signatures on messages whose timestamps are within the cryptoperiod of~~  
1442 ~~the private signature key. In this case, one is relying on the cryptographic timestamp~~  
1443 ~~function to assure that the message was signed within the signature key's originator-~~  
1444 ~~usage period.~~

- Deleted:** These systems can have a public signature-verification key cryptoperiod that is about the same as the private signature key cryptoperiod.
- Deleted:** validate
- Deleted:** verification
- Deleted:** its cryptoperiod.

1445 3. *Symmetric authentication key:*

1446 a. Type Considerations: The cryptoperiod of a symmetric authentication key<sup>21</sup> depends  
1447 on the sensitivity of the type of information it protects and the protection afforded by  
1448 the key. For very sensitive information, the authentication key may need to be unique to  
1449 the protected information. For less sensitive information, suitable cryptoperiods may  
1450 extend beyond a single use of the key. The originator-usage period of a symmetric  
1451 authentication key applies to the use of that key in applying the original cryptographic  
1452 protection for the information (e.g., computing the MAC); new MACs **shall not** be  
1453 computed on information using that key after the end of the originator-usage period.  
1454 However, the key may need to be available to verify the MAC on the protected data  
1455 beyond the originator-usage period (i.e., the recipient-usage period extends beyond the  
1456 originator-usage period). ~~The recipient-usage period is the period during which a MAC~~  
1457 ~~generated during the originator-usage period needs to be verified.~~ Note that if a MAC  
1458 key is compromised, it may be possible for an adversary to modify the data, and then  
1459 recalculate the MAC.

- Deleted:** to be associated with the authenticated information
- Deleted:** that was authenticated

1460 b. Cryptoperiod: Given the use of **approved** algorithms and key sizes, and an  
1461 expectation that the security of the key-storage and use environment will increase as the  
1462 sensitivity and/or criticality of the processes for which the key provides integrity  
1463 protection increases, a maximum originator-usage period of up to ~~two~~ years is  
1464 recommended, and a maximum recipient-usage period of ~~three~~ years beyond the end of  
1465 the originator-usage period is recommended.

- Deleted:** 2
- Deleted:** 3

1466 4. *Private authentication key:*

1467 a. Type Considerations: A private authentication key<sup>22</sup> may be used multiple times. Its  
1468 ~~corresponding~~ public key could be certified, for example, by a Certification Authority.  
1469 In most cases, the cryptoperiod of the ~~private~~ authentication key is the same as the  
1470 cryptoperiod of the ~~corresponding~~ public key.

- Deleted:** associated
- Deleted:** private
- Deleted:** associated

<sup>21</sup> [Used to enable data integrity and source authentication.](#)

<sup>22</sup> [Which may be used to enable data integrity and source authentication, as well as non-repudiation.](#)

1486 b. Cryptoperiod: An appropriate cryptoperiod for a private authentication key would be  
1487 one to two years, depending on its usage environment and the sensitivity/criticality of  
1488 the authenticated information.

**Deleted:** 1-2

1489 5. *Public authentication key:*

1490 a. Type Considerations: In most cases, the cryptoperiod of a public authentication key  
1491 is the same as the cryptoperiod of the corresponding private authentication key. The  
1492 cryptoperiod is, in effect, the period during which the identity of the originator of  
1493 information protected by the corresponding private authentication key needs to be  
1494 verified, i.e., the information source needs to be authenticated<sup>23</sup>.

**Deleted:** associated

**Deleted:** associated

**Deleted:** private

1495 b. Cryptoperiod: An appropriate cryptoperiod for the public authentication key would  
1496 be one to two years, depending on its usage environment and the sensitivity/criticality  
1497 of the authenticated information.

**Deleted:** public

**Deleted:** 1-2

1498 6. *Symmetric data-encryption key:*

1499 a. Type Considerations: A symmetric data-encryption key is used to protect stored data,  
1500 messages or communications sessions. Based primarily on the consequences of  
1501 compromise, a data-encryption key that is used to encrypt large volumes of information  
1502 over a short period of time (e.g., for link encryption) **should** have a relatively short  
1503 originator-usage period. An encryption key used to encrypt less information over time  
1504 could have a longer originator-usage period. The originator-usage period of a  
1505 symmetric data-encryption key applies to the use of that key in applying the original  
1506 cryptographic protection for information (i.e., encrypting the information) (see Section  
1507 5.3.5).

**Deleted:** Section 5.3.5).

1508 During the originator-usage period, an encryption of the information may be performed  
1509 using the data-encryption key; the key **shall not** be used for performing an encryption  
1510 operation on information beyond this period. However, the key may need to be  
1511 available to decrypt the protected data beyond the originator-usage period (i.e., the  
1512 recipient-usage period may need to extend beyond the originator-usage period).

**Deleted:** encrypted by

1513 b. Cryptoperiod: The originator-usage period recommended for the encryption of large  
1514 volumes of information over a short period of time (e.g., for link encryption) is on the  
1515 order of a day or a week. An encryption key used to encrypt smaller volumes of  
1516 information might have an originator-usage period of up to two years. A maximum  
1517 recipient-usage period of three years beyond the end of the originator-usage period is  
1518 recommended.

**Deleted:** one month

**Deleted:** 3

1519 In the case of symmetric data-encryption keys that are used to encrypt single messages  
1520 or single communications sessions, the lifetime of the protected data could be months  
1521 or years because the encrypted messages may be stored for later reading. Where  
1522 information is maintained in encrypted form, the symmetric data-encryption keys need  
1523 to be maintained until that information is re-encrypted under a new key or destroyed.  
1524 Note that confidence in the confidentiality of the information is reduced with the  
1525 passage of time.

<sup>23</sup> While integrity protection is also provided, it is not the primary intention of this key.

1536 7. *Symmetric key-wrapping key:*

1537 a. Type Considerations: A symmetric key-wrapping key that is used to wrap (i.e.,  
1538 encrypt and integrity protect) very large numbers of keys over a short period of time  
1539 **should** have a relatively short originator-usage period. If a small number of keys are  
1540 wrapped, the originator-usage period of the key-wrapping key could be longer. The  
1541 originator-usage period of a symmetric key-wrapping key applies to the use of that key  
1542 in providing the key-wrapping protection for the keys; a wrapping operation shall not  
1543 be performed using a key-wrapping key whose originator-usage period has expired.  
1544 However, the key-wrapping key may need to be available to unwrap the protected keys  
1545 (i.e., decrypt and verify the integrity of the wrapped keys) beyond the originator-usage  
1546 period (i.e., the recipient-usage period may need to extend beyond the originator-usage  
1547 period); the recipient-usage period is the period of time during which keys wrapped  
1548 during the key-wrapping key's originator-usage period may need to be unwrapped.

1549 Some symmetric key-wrapping keys are used for only a single message or  
1550 communications session. In the case of these very short-term key-wrapping keys, an  
1551 appropriate cryptoperiod (i.e., which includes both the originator and recipient-usage  
1552 periods) is a single communication session. It is assumed that the wrapped key will not  
1553 be retained in its wrapped form, so the originator-usage period and recipient-usage  
1554 period of the key-wrapping key is the same. In other cases, key-wrapping keys may be  
1555 retained so that the files or messages encrypted by the wrapped keys may be recovered  
1556 later on. In this case the recipient-usage period may be significantly longer than the  
1557 originator-usage period of the key-wrapping key, and cryptoperiods lasting for years  
1558 may be employed.

1559 b. Cryptoperiod: The recommended originator-usage period for a symmetric key-  
1560 wrapping key that is used to wrap very large numbers of keys over a short period of  
1561 time is on the order of a day or a week. If a relatively small number of keys are to be  
1562 wrapped under the key-wrapping key, the originator-usage period of the key-wrapping  
1563 key could be up to two years. In the case of keys used for only a single message or  
1564 communications session, the cryptoperiod would be limited to a single communication  
1565 session. Except for the latter, a maximum recipient-usage period of three years beyond  
1566 the end of the originator-usage period is recommended.

1567 8. *Symmetric RBG keys:*

1568 a. Type Considerations: Symmetric RBG keys are used in deterministic random bit  
1569 generation functions. The **approved** RBGs in [SP800-90] control key changes (e.g.,  
1570 during reseeding). The cryptoperiod consists of only an originator-usage period.

1571 b. Cryptoperiod: Assuming the use of **approved** RBGs, the maximum cryptoperiod of  
1572 symmetric RBG keys is determined by the design of the RBG (see [SP800-90]).

1573 9. *Symmetric master key:*

1574 a. Type Considerations: A symmetric master key (also called a key-derivation key) may  
1575 be used multiple times to derive other keys using a (one-way) key-derivation function  
1576 or method (see Section 8.2.4). Therefore, the cryptoperiod consists of only an  
1577 originator-usage period for this key type. A suitable cryptoperiod depends on the nature  
1578 and use of the keys derived from the master key and on considerations provided earlier

1609 | in [Section 5.3](#). The cryptoperiod of a key derived from a master key could be relatively  
 1610 | short, e.g., a single use, communication session, or transaction. Alternatively, the  
 1611 | master key could be used over a longer period of time to derive (or re-derive) multiple  
 1612 | keys for the same or different purposes. The cryptoperiod of the derived keys depends  
 1613 | on their use (e.g., as symmetric data-encryption or [integrity](#) authentication keys).

**Deleted:** Section 5.3.

1614 | b. Cryptoperiod: An appropriate cryptoperiod for the symmetric master key might be  
 1615 | [one](#) year, depending on its usage environment and the sensitivity/criticality of the  
 1616 | information protected by the derived keys and the number of keys derived from the  
 1617 | master key.

**Deleted:** 1

1618 | 10. *Private key-transport key:*

1619 | a. Type Considerations: A private key-transport key may be used multiple times [to](#)  
 1620 | [decrypt keys](#). Due to the potential need to decrypt keys some time after they have been  
 1621 | encrypted for transport, the cryptoperiod of the private key-transport key may be longer  
 1622 | than the cryptoperiod of the associated public key. The cryptoperiod of the private key  
 1623 | is the length of time during which any keys encrypted by the [corresponding](#) public key-  
 1624 | transport key need to be decrypted.

**Deleted:** .

1625 | b. Cryptoperiod: Given 1) the use of **approved** algorithms and key sizes, 2) the volume  
 1626 | of information that may be protected by keys encrypted under the [corresponding](#) public  
 1627 | key-transport key, and 3) an expectation that the security of the key-storage and use  
 1628 | environment will increase as the sensitivity and/or criticality of the processes for which  
 1629 | the key provides protection increases; a maximum cryptoperiod of about [two](#) years is  
 1630 | recommended [for the private key-transport key](#). In certain applications (e.g., email),  
 1631 | where received messages are stored and decrypted at a later time, the cryptoperiod of  
 1632 | the private key-transport key may exceed the cryptoperiod of the public key-transport  
 1633 | key.

**Deleted:** associated

**Deleted:** associated

**Deleted:** 2

1634 | 11. *Public key-transport key:*

1635 | a. Type Considerations: The cryptoperiod for the public key-transport key is that period  
 1636 | of time during which the public key may be used to actually apply the encryption  
 1637 | operation to the keys that will be protected. [When the public key has been certified by a](#)  
 1638 | [CA, the cryptoperiod ends when the \*notAfter\* date is reached on the last certificate](#)  
 1639 | [issued for the public key.](#)

1640 | Public key-transport keys can be publicly known. As indicated in the private key-  
 1641 | transport key discussion, due to the potential need to decrypt keys some time after they  
 1642 | have been encrypted for transport, the cryptoperiod of the public key-transport key may  
 1643 | be shorter than that of the [corresponding](#) private key.

**Deleted:** The driving factor in establishing the public key-transport key cryptoperiod is the cryptoperiod of the associated private key-transport key.

**Deleted:** associated

1644 | b. Cryptoperiod: Based on cryptoperiod assumptions for [the corresponding](#) private  
 1645 | keys, a recommendation for the maximum cryptoperiod might be about [one to two](#)  
 1646 | years.

**Deleted:** associated

**Deleted:** 1 - 2

1647 | 12. *Symmetric key-agreement key:*

1648 | a. Type Considerations: A symmetric key-agreement key may be used multiple times.  
 1649 | [The cryptoperiod of these keys depends on 1\) environmental security factors, 2\) the](#)  
 1650 | [nature \(e.g., types and formats\) and volume of keys that are established, and 3\) the](#)

**Deleted:** Generally, the originator-usage period and the recipient-usage period are the same.

1666 details of the key-agreement algorithms and protocols employed. Note that symmetric  
1667 key-agreement keys may be used to establish symmetric keys (e.g., symmetric data  
1668 encryption keys) or other keying material (e.g., IVs).

1669 b. Cryptoperiod: Given an assumption that the cryptography that employs symmetric  
1670 key-agreement keys 1) employs an **approved** algorithm and key scheme, 2) the  
1671 cryptographic device meets [\[FIPS140\]](#) requirements, and 3) the risk levels are  
1672 established in conformance to [\[FIPS199\]](#), an appropriate cryptoperiod for the key  
1673 would be one to two years. In certain applications (e.g., email), where received  
1674 messages are stored and decrypted at a later time, the recipient-usage period of the key  
1675 may exceed the originator-usage period.

Deleted: [FIPS140]  
Deleted: [FIPS199],  
Deleted: 1-2

1676 13. *Private static key-agreement key:*

1677 a. Type Considerations: A private static (i.e., long-term) key-agreement key may be  
1678 used multiple times. When the corresponding public key has been certified by a CA, the  
1679 cryptoperiod ends when the *notAfter* date is reached on the last certificate issued for the  
1680 public key.

1681 As in the case of symmetric key-agreement keys, the cryptoperiod of these keys  
1682 depends on 1) environmental security factors, 2) the nature (e.g., types and formats) and  
1683 volume of keys that are established, and 3) the details of the key-agreement algorithms  
1684 and protocols employed. Note that private static key-agreement keys may be used to  
1685 establish symmetric keys (e.g., key-wrapping keys) or other secret keying material.

1686 b. Cryptoperiod: Given an assumption that the cryptography that employs private static  
1687 key-agreement keys 1) employs an **approved** algorithm and key scheme, 2) the  
1688 cryptographic device meets [\[FIPS140\]](#) requirements, and 3) the risk levels are  
1689 established in conformance to [\[FIPS199\]](#), an appropriate cryptoperiod for the key  
1690 would be one to two years. In certain applications (e.g., email), where received  
1691 messages are stored and decrypted at a later time, the cryptoperiod of the private static  
1692 key-agreement key may exceed the cryptoperiod of the corresponding public static key-  
1693 agreement key.

Deleted: [FIPS140]  
Deleted: [FIPS199],  
Deleted: 1-2

Deleted: associated with the private key

1694 14. *Public static key-agreement key:*

1695 a. Type Considerations: The cryptoperiod for a public static (i.e., long-term) key-  
1696 agreement key is usually the same as the cryptoperiod of the corresponding private  
1697 static key-agreement key.

Deleted: associated private static key-agreement key. See the discussion for the

1698 b. Cryptoperiod: The cryptoperiod of the public static key-agreement key may be one to  
1699 two years.

Deleted: 1-2

1700 15. *Private ephemeral key-agreement key:*

1701 a. Type Considerations: Private ephemeral (i.e., short-term) key-agreement keys are the  
1702 private key elements of asymmetric key pairs that are used in a single transaction to  
1703 establish one or more keys. Private ephemeral key-agreement keys may be used to  
1704 establish symmetric keys (e.g., key-wrapping keys) or other secret keying material.

1705 b. Cryptoperiod: Private ephemeral key-agreement keys are used for a single key-  
1706 agreement transaction. However, a private ephemeral key may be used multiple times  
1707 to establish the same symmetric key with multiple parties during the same transaction

1718 (broadcast). The cryptoperiod of a private ephemeral key-agreement key is the duration  
1719 of a single key-agreement transaction.

1720 16. *Public ephemeral key-agreement key:*

1721 a. Type Considerations: Public ephemeral [\(i.e., short-term\)](#) key-agreement keys are the  
1722 public key elements of asymmetric key pairs that are used only once to establish one or  
1723 more keys.

1724 b. Cryptoperiod: Public ephemeral key-agreement keys are used for a single key-  
1725 agreement transaction. The cryptoperiod of the public ephemeral key-agreement key  
1726 ends immediately after it is used to generate the shared secret. Note that in some cases,  
1727 the cryptoperiod of the public ephemeral key-agreement key may be different for the  
1728 participants in the key-agreement transaction. For example, consider an encrypted  
1729 email application in which the email sender generates an ephemeral key-agreement key  
1730 pair, and then uses the key pair to generate an encryption key that is used to encrypt the  
1731 contents of the email. For the sender, the cryptoperiod of the public key ends when the  
1732 shared secret is generated and the *encryption* key is derived. However, for the  
1733 encrypted email receiver, the cryptoperiod of the ephemeral public key does not end  
1734 until the shared secret is generated and the *decryption* key is [determined](#); if the email is  
1735 not processed immediately upon receipt (e.g., it is decrypted a week later than the email  
1736 was sent), then the cryptoperiod of the ephemeral public key does not end (from the  
1737 perspective of the receiver) until the shared secret is generated that uses that public key.

Deleted: derived

1738 17. *Symmetric authorization key:*

1739 a. Type Considerations: A symmetric authorization key may be used for an extended  
1740 period of time, depending on the resources that are protected and the role of the entity  
1741 authorized for access. For this key type, the originator-usage period and the recipient-  
1742 usage period are the same. Primary considerations in establishing the cryptoperiod for  
1743 symmetric authorization keys include the robustness of the key, the adequacy of the  
1744 cryptographic method, and the adequacy of key-protection mechanisms and procedures.

1745 b. Cryptoperiod: Given the use of **approved** algorithms and key sizes, and an  
1746 expectation that the security of the key-storage and use environment will increase as the  
1747 sensitivity and criticality of the authorization processes increases, it is recommended  
1748 that cryptoperiods be no more than two years.

1749 18. *Private authorization key:*

1750 a. Type Considerations: A private authorization key may be used for an extended  
1751 period of time, depending on the resources that are protected and the role of the entity  
1752 authorized for access. Primary considerations in establishing the cryptoperiod for  
1753 private authorization keys include the robustness of the key, the adequacy of the  
1754 cryptographic method, and the adequacy of key-protection mechanisms and procedures.  
1755 The cryptoperiod of the private authorization key and its [corresponding](#) public key  
1756 **shall** be the same.

Deleted: associated

1757 b. Cryptoperiod: Given the use of **approved** algorithms and key sizes, and an  
1758 expectation that the security of the key-storage and use environment will increase as the  
1759 sensitivity and criticality of the authorization processes increases, it is recommended  
1760 that cryptoperiods for private authorization keys be no more than two years.

1763 19. *Public authorization key:*

1764 a. Type Considerations: A public authorization key is the public element of an  
 1765 asymmetric key pair used to verify privileges for an entity that possesses the  
 1766 corresponding private key.

1767 b. Cryptoperiod: The cryptoperiod of the public authorization key **shall** be the same as  
 1768 the private authorization key: no more than two years.

1769 Table 1, below is a summary of the cryptoperiods that are suggested for each key type. Longer  
 1770 or shorter cryptoperiods may be warranted, depending on the application and environment in  
 1771 which the keys will be used. However, when assigning a longer cryptoperiod than that  
 1772 suggested below, serious consideration **should** be given to the risks associated with doing so  
 1773 (see Section 5.3.1).

1774 **Table 1: Suggested cryptoperiods for key types<sup>24</sup>**

Key Type	Cryptoperiod	
	Originator-Usage Period (OUP)	Recipient-Usage Period
1. Private Signature Key	1-3 years	=
2. Public Signature-Verification Key	Several years (depends on key size)	
3. Symmetric Authentication Key	≤ 2 years	≤ OUP + 3 years
4. Private Authentication Key	1-2 years	
5. Public Authentication Key	1-2 years	
6. Symmetric Data Encryption Keys	≤ 2 years	≤ OUP + 3 years
7. Symmetric Key Wrapping Key	≤ 2 years	≤ OUP + 3 years
8. Symmetric RBG Keys	See [SP800-90]	=
9. Symmetric Master Key	About 1 year	=
10. Private Key Transport Key	< 2 years <sup>25</sup>	
11. Public Key Transport Key	1-2 years	
12. Symmetric Key Agreement Key	1-2 years <sup>26</sup>	
13. Private Static Key Agreement Key	1-2 years <sup>27</sup>	

<sup>24</sup> In some cases, risk factors affect the cryptoperiod selection (see Section 5.3.1).

<sup>25</sup> In certain email applications where received messages are stored and decrypted at a later time, the cryptoperiod of the private key-transport key may exceed the cryptoperiod of the public key-transport key.

<sup>26</sup> In certain email applications where received messages are stored and decrypted at a later time, the key's recipient-usage period key may exceed the originator-usage period.

1782 **5.3.7 Recommendations for Other Keying Material**

1783 Other keying material does not have well-established cryptoperiods, per se. The following  
1784 recommendations are offered regarding the disposition of this other keying material:

- 1785 1. Domain parameters remain in effect until changed.
- 1786 2. An IV is associated with the information that it helps to protect, and is needed until the  
1787 information ~~in its cryptographically protected form is~~ no longer needed.
- 1788 3. Shared secrets generated during the execution of key-agreement schemes **shall** be  
1789 destroyed as soon as they are no longer needed to derive keying material.
- 1790 4. ~~RBG~~ seeds **shall** be destroyed immediately after use.
- 1791 5. Other public information **should not** be retained longer than needed for cryptographic  
1792 processing.
- 1793 6. Other secret information **shall not** be retained longer than necessary.
- 1794 7. Intermediate results **shall** be destroyed immediately after use.

**Deleted:** and its protection are

**Deleted:** RNG

1795 **5.4 Assurances**

1796 When cryptographic keys and domain parameters are stored or distributed, they may pass  
1797 through unprotected environments. In this case, specific assurances ~~are~~ required before the key  
1798 or domain parameters may be used to perform normal cryptographic operations.

**Deleted:** may be

<sup>27</sup> In certain email applications whereby received messages are stored and decrypted at a later time, the cryptoperiod of the private static key-agreement key may exceed the cryptoperiod of the public static key-agreement key.

1802 | **5.4.1 Assurance of Integrity (Integrity Protection)**

Deleted: Also

1803 Assurance of integrity **shall** be obtained prior to using all keying material.

1804 At a minimum, assurance of integrity **shall** be obtained by verifying that the keying material  
 1805 has the appropriate format and came from an authorized source. Additional assurance of  
 1806 integrity may be obtained by the proper use of error detection codes, message authentication  
 1807 codes, and digital signatures.

1808 | **5.4.2 Assurance of Domain Parameter Validity**

Deleted: some

1809 Domain parameters are used by [discrete log](#) public-key algorithms during the generation of key  
 1810 pairs and digital signatures, and during the generation of shared secrets (during the execution  
 1811 of a key-agreement scheme) that are subsequently used to derive keying material. Assurance of  
 1812 the validity of the domain parameters is important to applications of public-key cryptography  
 1813 and **shall** be obtained prior to using them.

1814 Invalid domain parameters could void all intended security for all entities using the domain  
 1815 parameters. Methods [for](#) obtaining assurance of domain-parameter validity for [the DSA](#) and  
 1816 [ECDSA digital signature](#) algorithms are provided in [\[SP800-89\]](#). Methods for obtaining  
 1817 assurance [of domain-parameter validity](#) for [finite-field](#) and elliptic-curve discrete-log key-  
 1818 [agreement](#) algorithms are provided in [\[SP800-56A\]](#).

1819 [Note that if a public key is certified by a CA for these algorithms, the CA could obtain this](#)  
 1820 [assurance during the certification process. Otherwise, the key-pair owner and any relying](#)  
 1821 [parties are responsible for obtaining the assurance.](#)

1822 | **5.4.3 Assurance of Public-Key Validity**

1823 Assurance of public-key validity **shall** be obtained on all public keys before using them.

1824 Assurance of public-key validity gives the user confidence that the public key is arithmetically  
 1825 correct. This reduces the probability of using weak or corrupted keys. Invalid public keys could  
 1826 result in voiding the intended security, including the security of the operation (i.e., digital  
 1827 signature, key establishment, [or](#) encryption), leaking some or all information from the owner's  
 1828 private key, and leaking some or all information about a private key that is combined with an  
 1829 invalid public key (as may be done when key agreement or public-key encryption is  
 1830 performed). One of several ways to obtain assurance of validity is [for an entity](#) to verify certain  
 1831 mathematical properties that the public key should have. Another way is to obtain the  
 1832 assurance from a trusted third party ([e.g., a CA](#)) that the trusted party validated the properties.

1833 Methods of obtaining assurance of public-key validity for [the DSA](#), [ECDSA](#) and [RSA digital](#)  
 1834 [signature](#) algorithms are provided in [\[SP800-89\]](#). Methods for obtaining this assurance for [the](#)  
 1835 [finite-field](#) and elliptic-curve discrete-log key-establishment [schemes](#) are provided in [\[SP800-](#)  
 1836 [56A\]](#). Methods for obtaining assurance of (partial) public-key validity for [the RSA key-](#)  
 1837 [establishment schemes](#) are provided in [\[SP800-56B\]](#).

1838 | **5.4.4 Assurance of Private-Key Possession**

1839 Assurance of static ([i.e., long-term](#)) private-key possession **shall** be obtained before the use of  
 1840 the corresponding static public key. Assurance of validity **shall** always be obtained prior to, or  
 1841 concurrently with, assurance of possession. Assurance of private-key possession **shall** be

1862 obtained by both the owner of the key pair and by other entities that receive the public key of  
1863 that key pair and use it to interact with the owner.

1864 For specific details regarding assurance of the possession of private key-establishment keys,  
1865 see [SP800-56A] and [SP800-56B]; for specific details regarding assurance of the possession  
1866 of private digital-signature keys, see [SP800-89]. Note that for public keys that are certified by  
1867 a CA, the CA could obtain this assurance during the certification process. Otherwise, the owner  
1868 and relying parties are responsible for obtaining the assurance.

1869 **5.5 Compromise of Keys and other Keying Material**

1870 Information protected by cryptographic mechanisms is secure only if the algorithms remain  
1871 strong, and the keys have not been compromised. Key compromise occurs when the protective  
1872 mechanisms for the key fail (e.g., the confidentiality, integrity or association of the key to its  
1873 owner fail - see Section 6), and the key can no longer be trusted to provide the required  
1874 security. When a key is compromised, all use of the key to apply cryptographic protection to  
1875 information (e.g., compute a digital signature or encrypt information) shall cease, and the  
1876 compromised key shall be revoked (see Section 8.3.5). However, the continued use of the key  
1877 under controlled circumstances to remove or verify the protections (e.g., decrypt or verify a  
1878 digital signature) may be warranted, depending on the risks of continued use and an  
1879 organization's Key Management Policy (see [SP800-57, Part 2]). The continued use of a  
1880 compromised key shall be limited to processing already-protected information. In this case, the  
1881 entity that uses the information shall be made fully aware of the dangers involved. Limiting the  
1882 cryptoperiod of the key limits the amount of material that would be compromised (exposed) if  
1883 the key were compromised. Using different keys for different purposes (e.g., different  
1884 applications, as well as different cryptographic mechanisms), as well as limiting the amount of  
1885 information protected by a single key, also achieves this purpose.

1886 The compromise of a key has the following implications:

- 1887 1. The unauthorized disclosure of a key means that another entity (an unauthorized entity)  
1888 may know the key and be able to use that key to perform computations requiring the  
1889 use of the key.

1890 In general, the unauthorized disclosure of a key used to provide confidentiality  
1891 protection<sup>28</sup> (i.e., via encryption) means that all information encrypted by that key could  
1892 be determined by unauthorized entities. For example, if a symmetric data-encryption  
1893 key is compromised, the unauthorized entity might use the key to decrypt past or future  
1894 encrypted information, i.e., the information is no longer confidential between the  
1895 authorized entities. In addition, a compromised key could be used by an adversary to  
1896 encrypt information of the adversary's choosing, thus providing false information.

1897 The unauthorized disclosure of a private signature key means that the integrity and non-  
1898 repudiation qualities of all data signed by that key are suspect. An unauthorized party in  
1899 possession of the private key could sign false information and make it appear to be  
1900 valid. In cases where it can be shown that the signed data was protected by other  
1901 mechanisms (e.g., physical security) from a time before the compromise, the signature  
1902 may still have some value. For example, if a signed message was received on day 1,

**Deleted:** The owner of the key pair obtains assurance of private key- possession by:¶  
<#>Generating the key pair, or¶  
<#>Performing a pair-wise consistency test (e.g., using the static private signature key to generate a digital signature, followed by a verification of the digital signature using the static public signature-verification key). Note that the key pair may have been generated by a trusted party and provided to the owner; the pair-wise consistency test will verify that the correct private key has been provided to the owner.¶  
For parties other than the key pair owner, assurance of private-key possession gives confidence that the claimed owner of the public key actually possessed the corresponding private key at some time. There are several ways of obtaining assurance of private-key possession, in this case. The assurance may be obtained by participating in a protocol with the claimed owner of the key that uses the private key as it is intended to be used. For example, a private digital-signature key may be confirmed by using it to sign data (see Section 8.1.5.1.1.1, item 1), and a private key-establishment key may be confirmed by performing a key-confirmation protocol with the claimed owner of the key (see [SP800-56A] and [SP800-56B]). In the case of key-establishment keys, assurance of private-key possession may be obtained using the private key to digitally sign a certificate request (see Section 8.1.5.1.1.2). Sometimes when a CA public key is distributed, the CA will sign its own public key to provide assurance of private-key possession. ¶

**Deleted:** [SP800-56A]

**Deleted:** [SP800-56B];

**Deleted:** [SP800-89].

**Deleted:** Section 6),

**Deleted:** Section 8.3.5).

**Deleted:** Part 2).

**Deleted:** known

**Deleted:** In the case of the unauthorized disclosure of a key used to provide integrity protection (e.g., via digital signatures), the integrity protection on the data may be lost. For example, if a private signature key is compromised, the unauthorized entity might sign messages as if they were originated by the key's real owner (either new messages or messages that are altered from their original contents), i.e., non-repudiation and the authenticity of the information are in question.¶

<sup>28</sup> As opposed to the confidentiality of a key that could, for example, be used as a signing private key.

1954 and it was later determined that the private signing key was compromised on day 15,  
1955 the receiver may still have confidence that the message is valid because it was  
1956 maintained in the receiver's possession, before day 15. Note that cryptographic  
1957 timestamping may also provide protection for messages signed before the private  
1958 signature key was compromised. However, the security provided by these other  
1959 mechanisms is now critical to the security of the signature. In addition, the non-  
1960 repudiation of the signed message may be questioned, since the private signature key  
1961 may have been disclosed to the message receiver, who then altered the message in some  
1962 way.

Deleted: .

1963 The disclosure of a CA's private signature key means that an adversary can create  
1964 fraudulent certificates and Certificate Revocation Lists (CRLs).

1965 2. A compromise of the integrity of a key means that the key is incorrect — either that the  
1966 key has been modified (either deliberately or accidentally), or that another key has been  
1967 substituted; this includes a deletion (non-availability) of the key. The substitution or  
1968 modification of a key used to provide integrity<sup>29</sup> calls into question the integrity of all  
1969 information protected by the key.

Deleted: -

1970 3. A compromise of a key's usage or application association means that the key could be  
1971 used for the wrong purpose (e.g., for key establishment instead of digital signatures) or  
1972 for the wrong application, and could result in the compromise of information protected  
1973 by the key.

Deleted: This information could have been provided by, or changed by, an unauthorized entity that knows the key. The substitution of a public or secret key that will be used (at a later time) to encrypt data could allow an unauthorized entity (who knows the decryption key) to decrypt data that was encrypted using the encryption key.

1974 4. A compromise of a key's association with the owner or other entity means that the  
1975 identity of the other entity cannot be assured (i.e., one does not know who the other  
1976 entity really is).

Deleted: ) or that information cannot be processed correctly (e.g., decrypted with the correct key).

1977 5. A compromise of a key's association with other information means that there is no  
1978 association at all, or the association is with the wrong "information". This could cause  
1979 the cryptographic services to fail, information to be lost, or the security of the  
1980 information to be compromised.

1981 Certain protective measures may be taken in order to minimize the likelihood or consequences  
1982 of a key compromise. The following procedures are usually involved:

- 1983 a. Limiting the amount of time a symmetric or private key is in plaintext form.
- 1984 b. Preventing humans from viewing plaintext symmetric and private keys.
- 1985 c. Restricting plaintext symmetric and private keys to physically protected containers.  
1986 This includes key generators, key-transport devices, key loaders, cryptographic  
1987 modules, and key-storage devices.
- 1988 d. Using integrity checks to ensure that the integrity of a key or its association with other  
1989 data has not been compromised. For example, keys may be wrapped (i.e., encrypted) in  
1990 such a manner that unauthorized modifications to the wrapped key or to the key's  
1991 metadata will be detected.

Deleted: wrapping

Deleted: associations

<sup>29</sup> As opposed to the integrity of a key that could, for example, be used for encryption.

- 2006 | e. Employing key confirmation (see [Section 4.2.5.5](#)) to help ensure that the proper key  
2007 | was, in fact, established.
- 2008 | f. Establishing an accountability system that keeps track of each access to symmetric and  
2009 | private keys in plaintext form.
- 2010 | g. Providing a cryptographic integrity check on the key (e.g., using a MAC or a digital  
2011 | signature).
- 2012 | h. The use of trusted timestamps for signed data.
- 2013 | i. Destroying keys as soon as they are no longer needed.
- 2014 | j. Creating a compromise-recovery plan, especially in the case of [the compromise of a CA](#)  
2015 | [key](#).
- 2016 | The worst form of key compromise is one that is not detected. Nevertheless, even in this case,  
2017 | certain protective measures can be taken. [Cryptographic Key Management Systems \(CKMSs\)](#)  
2018 | **should** be designed to mitigate the negative effects of a key compromise. A [CKMS](#) **should** be  
2019 | designed so that the compromise of a single key compromises as little data as possible. For  
2020 | example, a single cryptographic key could be used to protect the data of only a single user or a  
2021 | limited number of users, rather than a large number of users. Often, systems have alternative  
2022 | methods to authenticate communicating entities that do not rely solely on the possession of  
2023 | keys. The object is to avoid building a system with catastrophic weaknesses.
- 2024 | A compromise-recovery plan is essential for restoring cryptographic security services in the  
2025 | event of a key compromise. A compromise-recovery plan **shall** be documented and easily  
2026 | accessible. The plan may be included in the Key Management Practices Statement (see  
2027 | [\[SP800-57, Part 2\]](#)). If not, the Key Management Practices Statement **should** reference the  
2028 | compromise-recovery plan.
- 2029 | Although compromise recovery is primarily a local action, the repercussions of a key  
2030 | compromise are shared by the entire community that uses the system or equipment. Therefore,  
2031 | compromise-recovery procedures **should** include the community at large. For example,  
2032 | recovery from the compromise of a root CA's private signature key requires that all users of  
2033 | the infrastructure obtain and install a new trust anchor [certificate](#). Typically, this involves  
2034 | physical procedures that are expensive to implement. To avoid these expensive procedures,  
2035 | elaborate precautions to avoid compromise may be justified.
- 2036 | The compromise-recovery plan **should** contain:
- 2037 | 1. The identification of the personnel to notify,
  - 2038 | 2. The identification of the personnel to perform the recovery actions,
  - 2039 | 3. The [method for obtaining a new key \(i.e., re-keying\)](#),
  - 2040 | 4. An inventory of all cryptographic keys (e.g., the location of all certificates in a system),
  - 2041 | 5. The education of all appropriate personnel on the recovery procedures,
  - 2042 | 6. An identification of all personnel needed to support the recovery procedures,
  - 2043 | 7. Policies that key-revocation checking be enforced (to minimize the effect of a  
2044 | compromise),

### 2061 5.6 Guidance for Cryptographic Algorithm and Key-Size Selection

2062 Cryptographic algorithms that provide the security services identified in [Section 3](#) are specified  
2063 in Federal Information Processing Standards (FIPS) and NIST Recommendations. Several of  
2064 these algorithms are defined for a number of key sizes. This section provides guidance for the  
2065 selection of appropriate algorithms and key sizes.

Deleted: Section 3

2066 This section emphasizes the importance of acquiring cryptographic systems with appropriate  
2067 algorithm and key sizes to provide adequate protection for 1) the expected lifetime of the  
2068 system and 2) any data protected by that system during the expected lifetime of the data.

#### 2069 5.6.1 Comparable Algorithm Strengths

2070 Cryptographic algorithms [can](#) provide different “strengths” of security, depending on the  
2071 algorithm and the key size used ([when a key is employed](#)). [Table 2 gives the current estimates](#)  
2072 [for the maximum security strengths that the approved symmetric and asymmetric](#)  
2073 [cryptographic algorithms can provide, given keys of a specified length. These estimates were](#)  
2074 [made under the assumption that the keys used with those algorithms are generated and handled](#)  
2075 [in accordance with specific rules \(e.g., the keys are generated using RBGs that were seeded](#)  
2076 [with sufficient entropy\). However, these rules are often not followed, and the security provided](#)  
2077 [to the data protected by those keys may be somewhat less than the security strength estimates](#)  
2078 [provided](#)

Deleted: . In this discussion,

2079 Two algorithms are considered to be of comparable strength for the given key sizes ( $X$  and  $Y$ ) if  
2080 the amount of work needed to “break the algorithms” or determine the keys (with the given key  
2081 sizes [and sufficient entropy](#)) is approximately the same using a given resource. The security  
2082 strength of an algorithm for a given key size is traditionally described in terms of the amount of  
2083 work it takes to try all keys for a symmetric algorithm with a key size of “ $X$ ” that has no short-  
2084 cut attacks (i.e., the most efficient attack is to try all possible keys). In this case, the best attack  
2085 is said to be the exhaustion attack. An algorithm that has a  $Y$ -bit key, but whose [estimated](#)  
2086 [maximum security](#) strength is comparable to a symmetric algorithm [with an  \$X\$ -bit key](#) is said  
2087 have [an “estimated maximum](#) security strength of  $X$  bits” or [to be able](#) to provide “ $X$  bits of  
2088 security”. Given a few plaintext blocks and corresponding ciphertext, an algorithm that [can](#)  
2089 [provide](#)  $X$  bits of security would, on average, take  $2^{X-1}T$  units of time to attack, where  $T$  is the  
2090 amount of time that is required to perform one encryption of a plaintext value and compare the  
2091 result against the corresponding ciphertext value.

Deleted: an  $X$ -bit key of such

Deleted: a “

Deleted: provides

2092 Determining the security strength of an algorithm can be nontrivial. For example, consider  
2093 TDEA, which uses three 56-bit keys ( $K_1$ ,  $K_2$  and  $K_3$ ). If each of these keys is independently

2103 generated, then this is called three-key TDEA (3TDEA). However, if  $K_1$  and  $K_2$  are  
 2104 independently generated, and  $K_3$  is set equal to  $K_1$ , then this is called two-key TDEA  
 2105 (2TDEA). One might expect that 3TDEA would provide  $56 \times 3 = 168$  bits of strength.  
 2106 However, there is an attack on 3TDEA that reduces the strength to the work that would be  
 2107 involved in exhausting a 112-bit key. For 2TDEA, if exhaustion were the best attack, then the  
 2108 strength of 2TDEA would be  $56 \times 2 = 112$  bits. This appears to be the case if the attacker has  
 2109 only a few matched plain and cipher pairs. However, the security strength of 2TDEA decreases  
 2110 as the number of matched plaintext/ciphertext pairs increases. If the attacker can obtain  
 2111 approximately  $2^{40}$  such pairs, and has sufficient memory and computational power, then  
 2112 2TDEA can provide an estimated maximum security strength of about 80 bits; if the attacker  
 2113 has  $2^{56}$  plaintext/ciphertext pairs, with significantly more memory and computational power,  
 2114 then the estimated maximum security strength would be about 56 bits.

**Deleted:** the three-key option or

**Deleted:** the two-key option or

**Deleted:** , then 2TDEA has a security strength of about 80

2115 The comparable key-size classes discussed in this section are based on estimates made as of the  
 2116 publication of this Recommendation using currently known methods. Advances in factoring  
 2117 algorithms, advances in general discrete-logarithm attacks, elliptic-curve discrete-logarithm  
 2118 attacks and quantum computing may affect these equivalencies in the future. New or improved  
 2119 attacks or technologies may be developed that leave some of the current algorithms completely  
 2120 insecure. If quantum attacks become practical, the asymmetric techniques may no longer be  
 2121 secure. Periodic reviews will be performed to determine whether the stated equivalencies need  
 2122 to be revised (e.g., the key sizes need to be increased) or the algorithms are no longer secure.

**Deleted:** recommended,

**Deleted:** assessments

2123 The use of strong cryptographic algorithms may mitigate security issues other than just brute-  
 2124 force cryptographic attacks. The algorithms may unintentionally be implemented in a manner  
 2125 that leaks small amounts of information about the key. In this case, the larger key may reduce  
 2126 the likelihood that this leaked information will eventually compromise the key.

2127 When selecting a block-cipher cryptographic algorithm (e.g., AES or TDEA), the block size  
 2128 may also be a factor that should be considered, since the amount of security provided by  
 2129 several of the modes defined in [SP800-38] is dependent on the block size. More information  
 2130 on this issue is provided in [SP800-38].

**Deleted:** [SP800-38]

**Deleted:** <sup>30</sup>

2131 Table 2 provides estimated, comparable maximum security strengths for the **approved**  
 2132 algorithms and key lengths.

**Deleted:** Table 2

**Deleted:** ; note that some of the larger key sizes are **not approved**.

2133 1. Column 1 indicates the estimated maximum security strength (in bits) provided by the  
 2134 algorithms and key sizes in a particular row. Note that the security strength is not  
 2135 necessarily the same as the length of the key, for the algorithms in the other columns,  
 2136 due to attacks on those algorithms that provide computational advantages.

**Deleted:** number of bits of

**Deleted:** number of bits of

**Deleted:** sizes

2137 2. Column 2 identifies the symmetric-key algorithms that can provide the security strength  
 2138 indicated in column 1, where 2TDEA and 3TDEA are specified in [SP800-67], and  
 2139 AES is specified in [FIPS197]. 2TDEA is TDEA with two different keys; 3TDEA is  
 2140 TDEA with three different keys.

**Deleted:** level of security (at a minimum),

**Deleted:** [SP800-67],

**Deleted:** [FIPS197].

2141 3. Column 3 indicates the minimum size of the parameters associated with the standards  
 2142 that use finite-field cryptography (FFC). Examples of such algorithms include DSA, as  
 2143 defined in [FIPS186], for digital signatures, and Diffie-Hellman (DH) and MQV key  
 2144 agreement, as defined in [SP800-56A], where  $L$  is the size of the public key, and  $N$  is  
 2145 the size of the private key.

- Moved (insertion) [4]

2217  
 2218 Note that some security strengths in the table do not indicate a hash function for the  
 2219 application; it is always acceptable to use a hash function with a higher estimated maximum  
 2220 security strength than that required for the application.

2221 Note that in the case of HMAC, which requires a key, the estimate assumes that a key whose  
 2222 length and entropy are at least equal to the security strength is used.

2223 For some applications, a cryptographic key is associated with the application and needs to be  
 2224 considered when determining the security strength actually afforded by the application. For  
 2225 example, for the generation of digital signatures, the minimum key length for the keys for a  
 2226 given security strength is provided in the FFC, IFC and ECC columns of Table 2; while for  
 2227 HMAC, the key lengths are discussed in [SP800-107].

- Deleted: Table 2;
- Deleted: [SP800-107].

2228 Note that hash functions and applications providing less than 112 bits of security strength  
 2229 (shaded in orange) are no longer approved for applying cryptographic protection on Federal  
 2230 government information (e.g., generating a digital signature). However, some flexibility is  
 2231 allowed for processing already-protected information at those security strengths (e.g., verifying  
 2232 digital signatures), if the receiving entity accepts the risks associated with doing so. See  
 2233 [SP800131A] for more detailed information.

2234  
 2235 **5.6.2 Defining Appropriate Algorithm Suites**

- Moved up [4]: Table 3: Hash function that can be used to provide the targeted security strengths#
- Deleted: Security Strength

2236 Many applications require the use of several different cryptographic algorithms. When several  
 2237 algorithms can be used to perform the same service, some algorithms are inherently more  
 2238 efficient because of their design (e.g., AES has been designed to be more efficient than  
 2239 TDEA).

- Deleted: Triple DEA

2240 In many cases, a variety of key sizes may be available for an algorithm. For some of the  
 2241 algorithms (e.g., public-key algorithms, such as RSA), the use of larger key sizes than are

2257 required may impact operations, e.g., larger keys may take longer to generate or longer to  
 2258 process the data. However, the use of key sizes that are too small may not provide adequate  
 2259 security.

2260 | [Table 4](#), provides general recommendations that may be used to select an appropriate suite of  
 2261 algorithms and key sizes for Federal Government unclassified applications to protect sensitive  
 2262 data. A schedule for increasing the security strengths for applying cryptographic protection to  
 2263 data (e.g., encrypting or digitally signing) is specified in the table. Transition details for  
 2264 algorithms, key sizes and applications are provided in [\[SP800-131A\]](#). The table is organized as  
 2265 follows:

**Deleted:** Table 4

2266 1. Column 1 is divided into two sub-columns. The first sub-column indicates the security  
 2267 strength to be provided; the second sub-column indicates whether cryptographic  
 2268 protection is being applied to data (e.g., encrypted), or whether cryptographically  
 2269 protected data is being processed (e.g., decrypted).  
 2270

2271 | 2. Columns 2, and 3 indicate the time frames during which the security strength is either  
 2272 acceptable, OK for legacy use or disallowed<sup>39</sup>.

**Deleted:** [SP800-131A].

- 2273
- “Acceptable” indicates that the algorithm or key length is not known to be insecure.
  - “Legacy-use” means that an algorithm or key length may be used because of its use in legacy applications (i.e., the algorithm or key length can be used to process cryptographically protected data).
  - “Disallowed” means that an algorithm or key length **shall not** be used for applying cryptographic protection.

2304

2305 If the security life of information extends beyond one time period specified in the table into the  
 2306 next time period (the later time period), the algorithms and key sizes specified for the later time  
 2307 period **shall** be used for applying cryptographic protection (e.g., encryption). The following  
 2308 examples are provided to clarify the use of the table:

- 2309 1. If information is cryptographically protected (e.g., digitally signed) in 2015, and the  
 2310 maximum-expected security life of that data is only one year, any of the **approved**  
 2311 digital-signature algorithms or key sizes that provide at least 112 bits of security  
 2312 strength may be used.
- 2313 2. If the information is to be digitally signed in 2025, and the expected security life of the  
 2314 data is six years, then an algorithm or key size that provides at least 128 bits of security  
 2315 strength is required.

- Deleted: 2012
- Deleted: 80 bits of security strength may be used. However, if only 80 bits of protection is used, there is some risk that needs to be accepted. Note that a digital signature that provides 80 bits of security could be processed (i.e., verified) after 2013 as indicated by the "legacy use" indication in the table.
- Deleted: 2012
- Deleted: 112

2316 **5.6.3 Using Algorithm Suites**

2317 Algorithm suites that combine algorithms with a mixture of estimated maximum security  
 2318 strengths is generally discouraged. However, algorithms of different strengths and key sizes  
 2319 may be used together for performance, availability or interoperability reasons, provided that  
 2320 sufficient protection is provided to the data to be protected. In general, the weakest algorithm  
 2321 and key size used to provide cryptographic protection determines the strength of the protection.  
 2322 A determination of the actual strength of the protection provided for information includes an  
 2323 analysis not only of the algorithm(s) and key size(s) used to apply the cryptographic  
 2324 protection(s) to the information, but also the details of how the key was generated (e.g., the  
 2325 security strength supported by the RBG used during the generation of the key) and how the key  
 2326 was handled subsequent to generation (e.g., was the key wrapped by an algorithm with a  
 2327 security strength less than the security strength intended for the key's use.

- Deleted: .
- Deleted: Exceptions to this principle require extensive analysis.
- Deleted: any algorithms and
- Deleted: sizes associated with establishing
- Deleted: (s) used
- Deleted: information protection, including those used by communication protocols

2328 The following is a list of several algorithm combinations and discussions on the security  
 2329 implications of the algorithm/key-size combination:

2357 1. When a key-establishment scheme is used to establish keying material for use with one  
2358 or more algorithms (e.g., TDEA, AES, or HMAC), the security strength that can be  
2359 supported by the keying material is determined by the weakest algorithm and key size  
2360 used. For example, if a 224-bit ECC key is used as specified in [SP80056A] to establish  
2361 a 128-bit AES key, no more than 112 bits of security can be provided for any  
2362 information protected by that AES key, since the 224-bit ECC can only provide a  
2363 maximum of 112 bits of security.

2364 2. When a hash function and digital signature algorithm are used in combination to  
2365 compute a digital signature, the security strength of the signature is determined by the  
2366 weaker of the two processes. For example, if SHA-256 is used with RSA and a 2048-bit  
2367 key, the combination can provide no more than 112 bits of security, because a 2048-bit  
2368 RSA key cannot provide more than 112 bits of security strength.

2369 3. When a random bit generator is used to generate a key for a cryptographic algorithm  
2370 that is intended to provide X bits of security, an **approved** random bit generator **shall**  
2371 be used that provides at least X bits of security.

2372 If it is determined that a specific level of security is required for the protection of data, then an  
2373 algorithm and key size suite needs to be selected that could provide that level of security (as a  
2374 minimum). For example, if 128 bits of security are required for data that is to be communicated  
2375 and provided with confidentiality, protection, and integrity, and source authentication, the  
2376 following selection of algorithms and key sizes may be appropriate:

2377 a. Confidentiality: Encrypt the information using AES-128. Other AES key sizes would  
2378 also be appropriate, but performance may be a little slower.

2379 b. Integrity, authentication and source authentication: If only one cryptographic operation  
2380 is preferred, use digital signatures. SHA-256 or a larger hash function could be used.  
2381 Select an algorithm for digital signatures from what is available to an application (e.g.,  
2382 ECDSA with at least a 256-bit key). If more than one algorithm and key size is  
2383 available, the selection may be based on algorithm performance, memory requirements,  
2384 etc., as long as the minimum requirements are met.

2385 c. Key establishment: Select a key-establishment scheme that is based on the application  
2386 and environment (see [SP800-56A] or [SP800-56B]), the availability of an algorithm in  
2387 an implementation, and its performance. Select a key size from Table 2, for an  
2388 algorithm and key size that can provide at least 128 bits of security. For example, if an  
2389 ECC key-agreement scheme is available, use an ECC scheme with at least a 256-bit key  
2390 (the value of f in Table 2). However, the key used for key agreement **shall** be different  
2391 from the ECDSA key used for digital signatures.

2392 Agencies that procure systems **should** consider the potential operational lifetime of the system.  
2393 The agencies **shall** either select algorithms that are expected to be secure during the entire  
2394 system lifetime, or **should** ensure that the algorithms and key sizes can be readily updated.

### 2395 5.6.4 Transitioning to New Algorithms and Key Sizes

2396 The estimated time period during which data protected by a specific cryptographic algorithm  
2397 (and key size) remains secure is called the *algorithm security lifetime*. During this time, the  
2398 algorithm may be used to both apply cryptographic protection (e.g., encrypt data) and to

**Deleted:** the

**Deleted:** .

2433 process the protected information (e.g., decrypt data); the algorithm is expected to provide  
2434 adequate protection for the protected data during this period.

2435 Typically, an organization selects the cryptographic services that are needed for a particular  
2436 application. Then, based on the algorithm security lifetime and the security life of the data to  
2437 be protected, an algorithm and key-size suite is selected that is sufficient to meet the  
2438 requirements. The organization then establishes a key-management system (if required),  
2439 including validated cryptographic products that provide the services required by the  
2440 application. As an algorithm and/or key-size suite nears the end of its security lifetime,  
2441 transitioning to a new algorithm and key-size suite **should** be planned.

Deleted: expiration date

2442 When the algorithm or key size is determined to no longer provide the desired protection for  
2443 information (e.g., the algorithm may have been "broken"), any information protected by the  
2444 algorithm or key size is considered to be suspect (e.g., the data may no longer be confidential,  
2445 or the integrity cannot be assured). If the protected data is retained, it **should** be re-protected  
2446 using an **approved** algorithm and key size that will protect the information for the remainder  
2447 of its security life. However, it **should** be assumed that encrypted information could have been  
2448 collected and retained by unauthorized entities (adversaries) for decryption at some later time.  
2449 In addition, the recovered plaintext could be used to attempt a matched plaintext-ciphertext  
2450 attack on the new algorithm.

Deleted: "

Deleted: "

Deleted: "

Deleted: "

Deleted: ). The unauthorized entity may attempt to decrypt the information

2451 When using Tables 2, 3 and 4 to select the appropriate algorithm and key size, it is very  
2452 important to take the expected security life of the data into consideration. As stated earlier, an  
2453 algorithm (and key size) may be used both to apply cryptographic protection to data and  
2454 process the protected data. When the security life of the data is taken into account,  
2455 cryptographic protection **should not** be applied to data using a given algorithm (and key size)  
2456 if the security life of the data extends beyond the end of the algorithm security lifetime (i.e.,  
2457 into the timeframe when the algorithm or key size is disallowed; see Table 4). The period of  
2458 time that an algorithm (and key size) may be used to apply cryptographic protection is called  
2459 the *algorithm originator-usage period*. The algorithm security life = (the algorithm usage  
2460 period + the security life of the data) (see Figure 2).

Deleted: Table 2

Deleted: Table 4

Deleted: deprecated or

Deleted: Table 4).

Deleted: ).

2461 For example, suppose that 3TDEA is to be used to provide confidentiality protection for data  
2462 with a security life of four years. Table 2 indicates that 3TDEA has a maximum security  
2463 strength of 112 bits. Table 4 indicates that an algorithm with a security strength of 112 bits has  
2464 an algorithm security lifetime that extends through 2030 for applying cryptographic protection  
2465 (i.e., encryption, in this case), but not beyond. Since the data has a four-year security life, the  
2466 algorithm originator-usage period must end by December 31, 2026 (rather than 2030) in order  
2467 to ensure that all data protected by 3TDEA is secure during its entire security life (i.e., the  
2468 algorithm could not be used to encrypt data beyond 2026). See Figure 2. After 2026, the  
2469 algorithm could be used to decrypt data for another four years, with the expectation that the  
2470 confidentiality of the data continues to be protected at a security strength of 112 bits. If the  
2471 security life of the data was estimated correctly, the data would no longer need this  
2472 confidentiality protection after 2030. However, if the security life of the data is longer than  
2473 originally expected, then the protection provided after 2030 may be less than required, and  
2474 there is some risk that the confidentiality of the data may be compromised (after 2030);  
2475 accepting the risk associated with the possible compromise is indicated by the "legacy use"  
2476 indication in Table 4.

Deleted: was first

Deleted: would have to

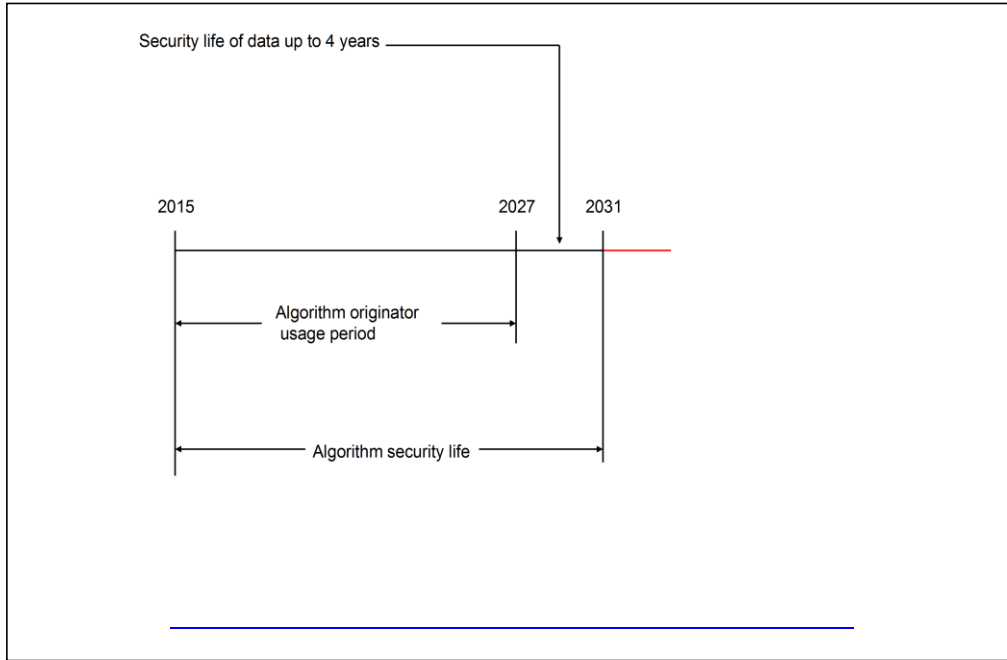

Deleted: in

Deleted: Figure 2.

Deleted: Table 4.

2501 When initiating cryptographic protections for information, the strongest algorithm and key size  
 2502 that is appropriate for providing the protection **should** be used in order to minimize costly  
 2503 transitions. However, it should be noted that selecting some algorithms or key sizes that are  
 2504 unnecessarily large might have adverse performance effects (e.g., the algorithm may be  
 2505 unacceptably slow).

**Figure 2: Algorithm Originator-Usage Period Example**

2506 | The process of transitioning to a new algorithm or a new key size may be as simple as selecting  
 2507 a more secure option in the security suites offered by the current system, or it can be as  
 2508 complex as building a whole new system. However, given that it is necessary to develop a new  
 2509 algorithm suite for a system, the following issues should be considered.

- 2510 | 1. **The sensitivity of information and the system lifetime:** The sensitivity of the  
 2511 information that will need to be protected by the system for the lifetime of the new  
 2512 algorithm(s) should be evaluated in order to determine the minimum security-  
 2513 requirement for the system. Care should be taken not to underestimate the required  
 2514 lifetime of the system or the sensitivity of information that it may need to protect.  
 2515 Many decisions that were initially considered as temporary or interim decisions  
 2516 about data sensitivity have since been proven to be inadequate (e.g., the sensitivity  
 2517 of the information lasted well beyond its initially expected lifetime).
- 2518 | 2. **Algorithm selection:** New algorithms should be carefully selected to ensure that  
 2519 they meet or exceed the minimum security-requirement of the system. In general, it  
 2520 is relatively easy to select cryptographic algorithms and key sizes that offer high

Deleted: The  
 Deleted: insure

2523 security. However, it is wise for the amateur to consult a cryptographic expert when  
2524 making such decisions. Systems **should** offer algorithm-suite options that provide  
2525 for future growth.

2526 | 3. **System design:** [A](#) new system **should** be designed to meet the minimum  
2527 performance and security requirements. This is often a difficult task, since  
2528 performance and security goals may conflict. All aspects of security (e.g., physical  
2529 security, computer security, operational security, and personnel security) are  
2530 | involved. If a current system is to be modified to incorporate new algorithms, the  
2531 consequences need to be analyzed. For example, the existing system may require  
2532 significant modifications to accommodate the footprints (e.g., key sizes, block sizes,  
2533 etc.) of the new algorithms. In addition, the security measures (other than the  
2534 cryptographic algorithms) retained from the current system **should** be reviewed to  
2535 assure that they will continue to be effective in the new system.

Deleted: The

Deleted: the

2536 | 4. **Pre-implementation evaluation:** Strong cryptography may be poorly  
2537 implemented. Therefore, a changeover to new cryptographic techniques **should not**  
2538 be made without an evaluation as to how effective and secure they are in the  
2539 system.

2540 | 5. **Testing:** Any system **should** be tested before it is employed.

Deleted: complex

2541 | 6. **Training:** If the new system requires that new or different tasks (e.g., key  
2542 management procedures) be performed, then the individuals who will perform those  
2543 tasks **should** be properly trained. Features that are thought to be improvements may  
2544 be viewed as annoyances by an untrained user.

2545 | 7. **System implementation and transition:** Care **should** be taken to implement the  
2546 system as closely as possible to the design. Exceptions **should** be noted.

2547 | 8. **Transition:** A transition plan **should** be developed and followed so that the  
2548 changeover from the old to the new system runs as smoothly as possible.

2549 | 9. **Post-implementation evaluation:** The system **should** be evaluated to verify that  
2550 | the implemented [system](#) meets the minimum security requirements.

Deleted: system as

Deleted: -

### 2551 5.6.5 Security Strength Reduction

2552 At some time, the security strength provided by an algorithm or key may be reduced or lost  
2553 completely. For example, the algorithm or key length used may no longer offer adequate  
2554 security because of improvements in computational capability or cryptanalysis. In this case,  
2555 applying protection to “new” information can be performed using stronger algorithms or keys.  
2556 | However, information that was previously protected using these [now-inadequate](#) algorithms  
2557 and keys may no longer be secure. This information may include other keys, or other sensitive  
2558 data protected by the keys. A reduction in the security strength provided by an algorithm or key  
2559 has the following implications:

- 2560 | • Encrypted information: The security of encrypted information that was [available](#) at any  
2561 time to unauthorized entities in its encrypted form should be considered suspect. For  
2562 example, keys that were transmitted in encrypted form ([e.g., using a key-wrapping key](#)  
2563 [or key-transport key and](#) an algorithm or key length that is later broken) may need to be  
2564 considered as compromised, since an adversary could have saved the encrypted form of

Deleted: exposed

Deleted: (e.g., a key-wrapping key or key-transport key),

2573 | the keys for later decryption in case methods for breaking the algorithm would  
2574 | eventually be found (see [Section 5.5](#) for a discussion of key compromise). Even if the  
2575 | transmitted, encrypted information is subsequently re-encrypted for storage using a  
2576 | different key or algorithm, the information may already be compromised because of the  
2577 | weakness of the transmission algorithm or key.

**Deleted:** if  
**Deleted:** are  
**Deleted:** Section 5.5

2578 | Encrypted information that was not "exposed" in this manner (e.g., not transmitted)  
2579 | may still be secure, even though the encryption algorithm or key length no longer  
2580 | provides adequate protection. For example, if the encrypted form of the keys and the  
2581 | information protected by those keys was never transmitted, then the information may  
2582 | still be confidential.

**Deleted:** However,

2583 | The lessons to be learned are that an encryption mechanism used for information that  
2584 | will be available to unauthorized entities in its encrypted form (e.g., via transmission)  
2585 | should provide a high level of security protection, and the use of each key should be  
2586 | limited (i.e., the cryptoperiod should be short) so that a compromised key cannot be  
2587 | used to reveal very much information. If the algorithm itself is broken<sup>40</sup>, an adversary is  
2588 | forced to perform more work when each key is used to encrypt a very limited amount  
2589 | of information, in order to decrypt all of the information. See [Section 5.3.6](#) for a  
2590 | discussion about cryptoperiods.

**Deleted:** exposed

**Deleted:** . See Section 5.3.6

2591 | • Digital signatures on stored data<sup>41</sup>: Digital signatures may be computed on data prior to  
2592 | transmission and subsequent storage. In this case, both the signed data and the digital  
2593 | signature would be stored. If the security strength of the signature is later reduced (e.g.,  
2594 | because of a break of the algorithm), the signature may still be valid if the stored data  
2595 | and its associated digital signature have been adequately protected from modification  
2596 | since a time prior to the reduction in strength (e.g., by applying a digital signature using  
2597 | a stronger algorithm or key). See [Section 5.5](#), item 1 for further discussion. Storage  
2598 | capabilities are being developed that employ cryptographic timestamps to store  
2599 | digitally signed data beyond the normal security life of the original signature  
2600 | mechanism or its keys.

**Deleted:** Section 5.5,

2601 | • Symmetric authentication codes on stored data<sup>42</sup>: Like digital signatures, symmetric  
2602 | authentication codes (i.e., MACs) may be computed on data prior to transmission and  
2603 | subsequent storage. If the received data and authentication code are stored as received,  
2604 | and the security strength of the authentication algorithm or key is later reduced (e.g.,  
2605 | because of a break of the algorithm), the authentication code may still be valid if the  
2606 | stored data and its associated authentication code have been adequately protected from  
2607 | modification since a time prior to the reduction in strength (e.g., by applying another  
2608 | authentication code using a stronger algorithm or key). See [Section 5.5](#), item 1 for  
2609 | further discussion. Storage capabilities are being developed that employ cryptographic

**Deleted:** Section 5.5,

<sup>40</sup> [It is easier to recover a key than exhaustive search.](#)

<sup>41</sup> Digital signatures on data that is transmitted, but not stored are not considered, as their value is considered to be short-lived, e.g., the digital signature was intended to be used to detect errors introduced only during transmission.

**Deleted:** only

<sup>42</sup> Symmetric authentication codes on data that is transmitted, but not stored are not considered, as their value is considered to be short-lived.

2618 timestamps to store authenticated data beyond the normal security life of the original  
2619 authentication mechanism or its keys.

2620

## 2621 6 Protection Requirements for Cryptographic Information

2622 This section gives guidance on the types of protection required for keying material.  
2623 Cryptographic keying material is defined as the cryptographic key and associated information  
2624 required to use the key (i.e., the metadata). The specific information varies, depending on the  
2625 type of key. The cryptographic keying material must be protected in order for the security  
2626 services to be “meaningful.” A FIPS 140-validated cryptographic module may provide much of  
2627 the protection needed; however, whenever the keying material exists external to a [FIPS140]  
2628 cryptographic module, additional protection is required. The type of protection needed depends  
2629 on the type of key and the security service for which the key is used. [SP800-152] provides  
2630 guidance for Federal Cryptographic Key Management Systems (FCKMSs) on the protection of  
2631 keys and metadata when outside a FIPS 140-validated cryptographic module, as well as other  
2632 key management factors to be addressed.

### 2633 6.1 Protection and Assurance Requirements

2634 Keying material **should** be (operationally) available as long as the associated cryptographic  
2635 service is required. Keys may be maintained within a cryptographic module while they are  
2636 being actively used, or they may be stored externally (provided that proper protection is  
2637 afforded) and recalled as needed. Some keys may need to be archived if required beyond the  
2638 key’s originator-usage period (see Section 5.3.5).

2639 The following protections and assurances may be required for the keying material.

2640 *Integrity protection shall* be provided for all keying material. Integrity protection always  
2641 involves checking the source and format of received keying material (see Section 5.4.1).  
2642 When the key exists within a validated cryptographic module, appropriate integrity  
2643 protection is provided when the cryptographic module conforms to [FIPS140], at a security  
2644 level that is consistent with the [FIPS 199] impact level associated with the data to be  
2645 protected by the key (see [SP800-152]). When a key is available outside a cryptographic  
2646 module, integrity protection shall be provided by appropriate cryptographic integrity  
2647 mechanisms (e.g. cryptographic checksums, cryptographic hash functions, MACs, and  
2648 digital signatures), non-cryptographic integrity mechanisms (e.g. CRCs, parity checks, etc.)  
2649 (see Appendix A) or physical protection mechanisms. Guidance for the selection of  
2650 appropriate integrity mechanisms is given in Sections 6.2.1.2 and 6.2.2.2.

2651 *Confidentiality protection* for all symmetric and private keys **shall** be provided. Public keys  
2652 generally do not require confidentiality protection. When the symmetric or private key  
2653 exists within a validated cryptographic module, appropriate confidentiality protection is  
2654 provided when the cryptographic module conforms to [FIPS140], at a security level that is  
2655 consistent with the [FIPS199] impact level associated with the data to be protected by the  
2656 key (see [SP800-152]). When a symmetric or private key is available outside a  
2657 cryptographic module, confidentiality protection **shall** be provided either by encryption  
2658 (e.g., key wrapping) at an appropriate security strength (see [SP800-152]), by the use of  
2659 separate key components (see Section 6.2.1.3) or by controlling access to the key via

2678 physical means (e.g. storing the keying material in a safe with limited access). The security  
2679 and operational impact of specific confidentiality mechanisms varies. Guidance for the  
2680 selection of appropriate confidentiality mechanisms is given in Sections [6.2.1.3](#) and [6.2.2.3](#).

Deleted: 6.2.1.3

Deleted: 6.2.2.3.

2681 *Association protection shall* be provided for a cryptographic security service by ensuring  
2682 that the correct keying material is used with the correct data in the correct application or  
2683 equipment. Guidance for the selection of appropriate association protection is given in  
2684 Sections [6.2.1.4](#) and [6.2.2.4](#).

Deleted: 6.2.1.4

Deleted: 6.2.2.4.

2685 *Assurance of domain-parameter and public-key validity* provides confidence that the  
2686 parameters and keys are arithmetically correct (see Sections [5.4.2](#) and [5.4.3](#)). Guidance for  
2687 the selection of appropriate validation mechanisms is given in [\[SP800-56A\]](#) and [\[SP800-](#)  
2688 [89\]](#), as well as [in](#) this document.

Deleted: 5.4.2

Deleted: 5.4.3).

Deleted: [SP800-56A]

Deleted: [SP800-89].

2689 *Assurance of private key possession* provides assurance that the owner of a public key  
2690 actually possesses the corresponding private key (see [Section 5.4.4](#)).

Deleted: Section 5.4.4).

2691 The *period of protection* for cryptographic keys, associated key information, and cryptographic  
2692 parameters (e.g. initialization vectors) depends on the type of key, the associated cryptographic  
2693 service, and the length of time for which the cryptographic service is required. The period of  
2694 protection includes the cryptoperiod of the key (see [Section 5.3](#)). The period of protection is  
2695 not necessarily the same for integrity as it is for confidentiality. Integrity protection may *only*  
2696 be required until a key is no longer used (*but not yet destroyed*), but confidentiality protection  
2697 may be required until the key is *actually* destroyed.

Deleted: Section 5.3).

Key Type	Security Service	Security Protection	Association Protection	Assurances Required	Period of Protection
Private signature key	<a href="#">Source</a> authentication; Integrity <a href="#">authentication</a> ; <a href="#">Support</a> non-repudiation	Integrity <sup>43</sup> ; Confidentiality	Usage or application; Domain parameters; Public signature-verification key	Possession	From generation until the end of the cryptoperiod
Public signature-verification key	<a href="#">Source</a> authentication; Integrity <a href="#">authentication</a> ; <a href="#">Support</a> non-repudiation	Integrity;	Usage or application; Key pair owner Domain parameters; Private signature key; Signed data	Validity	From generation until no protected data needs to be verified
Symmetric authentication key	<a href="#">Source</a> authentication; Integrity <a href="#">authentication</a>	Integrity; Confidentiality	Usage or application; Other authorized entities; Authenticated data		From generation until no protected data needs to be verified
Private authentication key	<a href="#">Source</a> authentication; Integrity <a href="#">authentication</a>	Integrity; Confidentiality	Usage or application; Public authentication key; Domain parameters	Possession	From generation until the end of the cryptoperiod

<sup>43</sup> Integrity protection can be provided by a variety of means. See Sections [6.2.1.2](#) and [6.2.2.2](#).

**Deleted:** 6.2.1.2  
**Deleted:** 6.2.2.2.

Public authentication key	<a href="#">Source</a> authentication; Integrity authentication	Integrity	Usage or application; Key pair owner; Authenticated data; Private authentication key; Domain parameters	Validity	From generation until no protected data needs to be authenticated
Symmetric data-encryption/decryption key	Confidentiality	Integrity; Confidentiality	Usage or application; Other authorized entities; Plaintext/Encrypted data		From generation until the end of the lifetime of the data or the end of the cryptoperiod, whichever comes later
Symmetric key-wrapping key	Support	Integrity; Confidentiality	Usage or application; Other authorized entities; Encrypted keys		From generation until the end of the cryptoperiod or until no wrapped keys require protection, whichever is later.
<del>Symmetric RBG keys</del>	Support	Integrity; Confidentiality	Usage or application		From generation until replaced
Symmetric master key	Support	Integrity; Confidentiality	Usage or application; Other authorized entities; Derived keys		From generation until the end of the cryptoperiod or the end of the lifetime of the derived keys, whichever is later.
Private key-transport key	Support	Integrity; Confidentiality	Usage or application; Encrypted keys; Public key-transport key	Possession	From generation until the end of the period of protection for all transported keys
Public key-transport key	Support	Integrity	Usage or application; Key pair owner; Private key-transport key	Validity	From generation until the end of the cryptoperiod
Symmetric key-agreement key	Support	Integrity; Confidentiality	Usage or application; Other authorized entities		From generation until the end of the cryptoperiod or until no longer needed to determine a key, whichever is later

**Deleted:** Possession of private RNG key, if used  
**Deleted:** and asymmetric RNG

Private static key-agreement key	Support	Integrity; Confidentiality	Usage or application; Domain parameters; Public static key-agreement key	Possession	From generation until the end of the cryptoperiod or until no longer needed to determine a key, whichever is later
Public static key-agreement key	Support	Integrity	Usage or application; Key pair owner; Domain parameters; Private static key-agreement key	Validity	From generation until the end of the cryptoperiod or until no longer needed to determine a key, whichever is later
Private ephemeral key-agreement key	Support	Integrity; Confidentiality	Usage or application; Public ephemeral key-agreement key; Domain parameters;		From generation until the end of the key-agreement process After the end of the process, the key <b>shall</b> be destroyed
Public ephemeral key-agreement key	Support	Integrity <sup>44</sup>	Key pair owner; Private ephemeral key-agreement key; Usage or application; Domain parameters	Validity	From generation until the key-agreement process is complete
Symmetric authorization keys	Authorization	Integrity; Confidentiality	Usage or application; Other authorized entities		From generation until the end of the cryptoperiod of the key
Private authorization key	Authorization	Integrity; Confidentiality	Usage or application; Public authorization key; Domain parameters	Possession	From generation until the end of the cryptoperiod of the key
Public authorization key	Authorization	Integrity	Usage or application; Key pair owner; Private authorization key; Domain parameters	Validity	From generation until the end of the cryptoperiod of the key

<sup>44</sup> The confidentiality of public ephemeral key-agreement keys may not be protected during transmission; however, the key-agreement protocols may be designed to detect unauthorized substitutions and modifications of the transmitted public ephemeral keys. In this case, the protocols form the data integrity mechanism.

2773 f. Column 6 (Period of Protection) indicates the length of time that the integrity and/or  
 2774 confidentiality of the cryptographic information needs to be maintained. The  
 2775 cryptographic information **shall** be destroyed at the end of the period of protection (see  
 2776 [Section 8.3.4](#)).

**Deleted:** Sections 8.3.4).

2777 **Table 6: Protection requirements for other cryptographic or related material**

Crypto. Information Type	Security Service	Security Protection	Association Protection	Assurance of Domain Parameter Validity	Period of Protection
Domain parameters	Depends on <a href="#">the</a> key assoc. with the parameters	Integrity	Usage or application; Private and public keys	Yes	From generation until no longer needed to generate keys or verify signatures
Initialization vectors	Depends on <a href="#">the</a> algorithm	Integrity <sup>45</sup>	Protected data		From generation until no longer needed to process the protected data

<sup>45</sup> IVs are not generally protected during transmission; however, the decryption system may be designed to detect or minimize the effect of unauthorized substitutions and modifications to transmitted IVs. In this case the decryption system is the data-integrity mechanism.

Shared secrets	Support	Confidentiality; Integrity			From generation until the end of the transaction.  The shared secret <b>shall</b> be destroyed at the end of the period of protection
<a href="#">RBG Seeds</a>	Support	Confidentiality; Integrity	Usage or application		Used once and destroyed immediately after use
Other public information	Support	Integrity	Usage or application;  Other authorized entities;  Data processed using the nonce		From generation until no longer needed to process data using the public information
Other secret information	Support	Confidentiality; Integrity	Usage or application;  Other authorized entities;  Data processed using the secret information		From generation until no longer needed to process data using the secret information
Intermediate results	Support	Confidentiality; Integrity	Usage or application		From generation until no longer needed and the intermediate results are destroyed
Key-control information (e.g., IDs, purpose)	Support	Integrity	Key		From generation until the associated key is destroyed
Random number	Support	Integrity; Confidentiality (depends on usage)			From generation until no longer needed, and the random number is destroyed
Password	<a href="#">Source</a> authentication; Key derivation	Integrity; Confidentiality	Usage or application;  Owning entity		From generation until replaced or no longer needed to authenticate the entity or to derive keys
Audit information	Support	Integrity;  Access authorization	Audited events;  Key control information		From generation until no longer needed

Deleted: RNG

2785 **6.2 Protection Mechanisms**

2786 During the lifetime of cryptographic information, the information is either “in transit” (e.g., is  
2787 in the process of being manually distributed or distributed using automated protocols to the  
2788 authorized [communication](#) participants for use by those entities), “at rest” (e.g., the information  
2789 is in storage) or “in use.” In [all cases](#), the keying material **shall** be protected in accordance with  
2790 [Section 6.1](#).

Deleted: communications

Deleted: ) or is

Deleted: ).

Deleted: either case

Deleted: Section 6.1. However

2797 | For keys that are in use, the keys shall reside (and be used) within appropriate cryptographic  
2798 | modules; note that a key being in use does not preclude that key from also being  
2799 | simultaneously in transit and/or in storage.

2800 | While in transit or in storage, the choice of protection mechanisms may vary. Although several  
2801 | methods of protection are provided in the following subsections, not all methods provide equal  
2802 | security. The method **should** be carefully selected. In addition, the mechanisms prescribed do  
2803 | not, by themselves, guarantee protection. The implementation and the associated key  
2804 | management need to provide adequate security to prevent any feasible attack from being  
2805 | successful.

2806 | **6.2.1 Protection Mechanisms for Cryptographic Information in Transit**

2807 | Cryptographic information in transit may be keying material that is being distributed in order  
2808 | to obtain a cryptographic service (e.g., establish a key that will be used to provide  
2809 | confidentiality) (see Section 8.1.5), cryptographic information that is being backed up or  
2810 | archived for possible use or recovery in the future (see Sections 8.2.2 and 8.3.1), or is in the  
2811 | process of being recovered (see Sections 8.2.2.2, 8.3.1 and Appendix B). This may be  
2812 | accomplished manually (i.e., via a trusted courier), in an automated fashion (i.e., using  
2813 | automated communication protocols) or by some combination of manual and automated  
2814 | methods. For some protocols, the protections are provided by the protocol; in other cases, the  
2815 | protection for the keying material is provided directly to the keying material (e.g., the keying  
2816 | material is encrypted prior to transmission for decryption only by the receiving party). It is the  
2817 | responsibility of the originating entity to apply protection mechanisms, and the responsibility  
2818 | of the recipient to undo or check the mechanisms used.

Deleted: Section 8.1.5), or  
Deleted: 8.2.2  
Deleted: 8.3.1).

Deleted: on  
Deleted: .

2819 | **6.2.1.1 Availability**

2820 | Since communications may be garbled, intentionally altered, or destroyed, the availability of  
2821 | cryptographic information after transit cannot be assured using cryptographic methods.  
2822 | However, availability can be supported by redundant or multiple channels, store and forward  
2823 | systems (deleting by the sender only after confirmation of receipt), error correction codes, and  
2824 | other non-cryptographic mechanisms.

2825 | Communication systems **should** incorporate non-cryptographic mechanisms to ensure the  
2826 | availability of transmitted cryptographic information after it has been successfully received,  
2827 | rather than relying on retransmission by the original sender for future availability

2828 | **6.2.1.2 Integrity**

2829 | Integrity protection involves both the prevention and detection of modifications to information.  
2830 | When modifications are detected, measures may be taken possible to restore the information to  
2831 | its unaltered form. Cryptographic mechanisms are often used to detect unauthorized  
2832 | modifications. The integrity of cryptographic information during transit **shall** be protected  
2833 | using one or more of the following mechanisms:

2834 | 1. Manual method (physical protection is provided):

- 2835 | (a) An integrity mechanism (e.g., a CRC, MAC or digital signature) is used on the  
2836 | information, and the resulting code is provided to the recipient for subsequent  
2837 | verification. Note: A CRC may be used instead of a MAC or digital signature, since  
2838 | the physical protection is only intended to protect against intentional modifications.

Deleted: comparable to a CRC  
Deleted: (e.g., CRC, MAC or digital signature)  
Deleted: .

2848 -OR-

2849 (b) The keying material is used to perform the intended cryptographic operation. If the  
2850 received information does not conform to the expected format, or the data is  
2851 inconsistent in the context of the application, then the keying material may have  
2852 been corrupted.

2853 2. Automated distribution via communication protocols (provided by the user or by the  
2854 communication protocol):

2855 (a) An **approved** cryptographic integrity mechanism (e.g., a MAC or digital signature)  
2856 is used on the information, and the resulting code is provided to the recipient for  
2857 subsequent verification. Note that a CRC is not **approved** for this purpose. The  
2858 integrity mechanism may be applied only to the cryptographic information, or may  
2859 be applied to an entire message

Deleted: (e.g., a MAC or digital signature)

2860 -OR-

2861 (b) The keying material is used to perform the intended cryptographic operation. If the  
2862 use of the keying material produces incorrect results, or the data is inconsistent in  
2863 the context of the application, then the received keying material may have been  
2864 corrupted.

2865 The response to the detection of an integrity failure will vary, depending on the specific  
2866 environment. Improper error handling can allow attacks (e.g., side channel attacks). A security  
2867 policy (see [\[SP800-57, Part 2\]](#)) **should** define the response to such an event. For example, if an  
2868 error is detected in the received information, and the receiver requires that the information is  
2869 entirely correct (e.g., the receiver cannot proceed when the information is in error), then:

Deleted: Part 2)

- 2870 a. The information **should not** be used,
- 2871 b. The recipient may request that the information be resent (retransmissions **should** be  
2872 limited to a predetermined maximum number of times), and
- 2873 c. Information related to the incident should be stored in an audit log to later identify the  
2874 source of the error.

Deleted: may

2875 **6.2.1.3 Confidentiality**

2876 Keying material may require confidentiality protection during transit. If confidentiality  
2877 protection is required, the keying material **shall** be protected using one or more of the  
2878 following mechanisms:

2879 1. Manual method:

2880 (a) The keying material is encrypted (e.g., wrapped) using an **approved technique that**  
2881 provides protection at a security strength that meets or exceeds the security strength  
2882 required of the keying material.

2883 -OR-

2884 (b) The keying material is separated into key components, with each key component  
2885 being generated at a security strength that meets or exceeds the security strength  
2886 required of the keying material. Each key component is handled, using split

2891 | knowledge procedures (see Sections [8.1.5.2.1](#), and [8.1.5.2.2.1](#)), so that no single  
2892 | individual can acquire access to all key components.

Deleted: 8.1.5.2.1

Deleted: 8.1.5.2.2.1),

2893 | -OR-

2894 | (c) Appropriate physical and procedural protection is provided (e.g., by using a trusted  
2895 | courier).

2896 | 2. Automated distribution via communication protocols: The keying material is encrypted  
2897 | [\(e.g., wrapped\)](#) using an **approved** technique that provides protection at the security  
2898 | [strength that meets or exceeds the security strength required of the keying material.](#)

Deleted: using an approved algorithm and key size

2899 | **6.2.1.4 Association with Usage or Application**

2900 | The association of keying material with its usage or application **shall** be either specifically  
2901 | identified during the distribution process or be implicitly defined by the use of the application.  
2902 | See [Section 6.2.3](#) for a discussion of the metadata associated with keys.

Deleted: Section 6.2.3 for

2903 | **6.2.1.5 Association with Other Entities**

2904 | The association of keying material with the appropriate entity (e.g., the [entity that shares the](#)  
2905 | [keying material](#)) **shall** be either specifically identified during the distribution process (e.g.,  
2906 | using public-key certificates) or be implicitly defined by the use of the application. See [Section](#)  
2907 | [6.2.3](#) for a discussion of the metadata associated with keys.

Deleted: key source

Deleted: Section 6.2.3

2908 | **6.2.1.6 Association with Other Related Information**

2909 | Any association with other related information (e.g., domain parameters, the  
2910 | encryption/decryption key or IVs) **shall** be either specifically identified during the distribution  
2911 | process or be implicitly defined by the use of the application. See [Section 6.2.3](#) for a discussion  
2912 | of the metadata associated with the other related information.

Deleted: Section 6.2.3

2913 | **6.2.2 Protection Mechanisms for Information in Storage**

2914 | Cryptographic information [may be](#) at rest in some device or storage media. This may include  
2915 | copies of the information that is also in transit [or in use](#). Information-at-rest (i.e., stored  
2916 | information, [including information contained within a cryptographic module](#)) **shall** be  
2917 | protected in accordance with [Section 6.1](#). A variety of protection mechanisms may be used.

Deleted: that is not in transit is

Deleted: Section 6.1.

2918 | The cryptographic information may be stored so as to be immediately available to an  
2919 | application (e.g., on a local hard disk or a server); this would be typical for keying material  
2920 | stored within a cryptographic module or in immediately accessible storage (e.g., on a local hard  
2921 | drive). The keying material may also be stored in electronic form on a removable media (e.g., a  
2922 | CD-ROM), in a remotely accessible location, or in hard copy form and placed in a safe; this  
2923 | would be typical for backup or archive storage.

2924 | **6.2.2.1 Availability**

2925 | Cryptographic information may need to be readily available for as long as data is protected by  
2926 | the information. A common method for providing this protection is to make one or more copies  
2927 | of the cryptographic information and store them in separate locations. During a key's  
2928 | cryptoperiod, keying material requiring long-term availability **should** be stored in both normal  
2929 | operational storage (see [Section 8.2.1](#)) and in backup storage (see [Section 8.2.2.1](#)).  
2930 | Cryptographic information that is retained after the end of a key's cryptoperiod **should** be

Deleted: Section 8.2.1)

Deleted: Section 8.2.2.1).

2943 | placed in archive storage (see [Section 8.3.1](#)). This Recommendation does not preclude the use  
2944 | of the same storage media for both backup and archive storage.

Deleted: Section 8.3.1).

2945 | Specifics on the long-term availability requirement for each key type are addressed for backup  
2946 | storage in [Section 8.2.2.1](#), and for archive storage in [Section 8.3.1](#).

Deleted: Section 8.2.2.1,

Deleted: Section 8.3.1.

2947 | The recovery of this cryptographic information for use in replacing cryptographic information  
2948 | that is lost (e.g., from normal storage), or in performing cryptographic operations after the end  
2949 | of a key's cryptoperiod is discussed in Sections [8.2.2.2](#) (recovery during normal operations)  
2950 | and [8.3.1](#) (recovery from archive storage), and in [Appendix B](#).

Deleted: 8.2.2.2

Deleted: 8.3.1

Deleted: Appendix B.

### 2951 | **6.2.2.2 Integrity**

2952 | Integrity protection is concerned with ensuring that the information is correct. Absolute  
2953 | protection against modification is not possible. The best that can be done is to use reasonable  
2954 | measures to prevent modifications, to use methods to detect any modifications that occur (with  
2955 | a very high probability), and to restore the information to its original content when  
2956 | modifications have been detected.

2957 | All cryptographic information requires integrity protection. Integrity protection **shall** be  
2958 | provided by physical mechanisms, cryptographic mechanisms or both.

2959 | Physical mechanisms include:

- 2960 | 1. A validated cryptographic module or operating system that limits access to the stored  
2961 | information,
- 2962 | 2. A computer system or media that is not connected to other systems,
- 2963 | 3. A physically secure environment with appropriate access controls that is outside a  
2964 | computer system (e.g., in a safe with limited access).

2965 | Cryptographic mechanisms include:

- 2966 | a. An **approved** cryptographic integrity mechanism (e.g., a MAC or digital signature) that  
2967 | is computed on the information and is later used to verify the integrity of the stored  
2968 | information.
- 2969 | b. Performing the intended cryptographic operation; this assumes that the correct result is  
2970 | easily determined. If the received information is incorrect, it is possible that the keying  
2971 | material may have been corrupted.

2972 | In order to restore the cryptographic information when an error is detected, one or more copies  
2973 | of the information **should** be maintained in physically separate locations (i.e., in backup or  
2974 | archive storage; see Sections [8.2.2.1](#) and [8.3.1](#)). The integrity of each copy **should** be  
2975 | periodically checked.

Deleted: multiple

Deleted: 8.2.2.1

Deleted: 8.3.1).

### 2976 | **6.2.2.3 Confidentiality**

2977 | One of the following mechanisms **shall** be used to provide confidentiality for private or secret  
2978 | keying material in storage:

- 2979 | 1. Encryption (or key wrapping) with an **approved** algorithm in a [\[FIPS140\]](#)  
2980 | cryptographic module; the encryption shall use an approved technique that  
2981 | provides protection at the security strength that meets or exceeds the security

Deleted: [FIPS140]

Deleted: .

- 2993 | [strength required of the keying material](#). It **shall** be no easier to recover the key-  
2994 | [wrapping](#) key) than it is to recover the key being encrypted [\(or wrapped\)](#).
- 2995 | -OR-
- 2996 | 2. Physical protection provided by a [FIPS140] cryptographic module, [at a security](#)  
2997 | [level that is consistent with the \[FIPS199\] impact level associated with the data to](#)  
2998 | [be protected by the key \(see \[SP800-152\]\)](#).
- 2999 | -OR-
- 3000 | 3. Physical protection provided by secure storage with controlled access (e.g., a safe or  
3001 | protected area).

Deleted: encrypting

Deleted: ,

Deleted: (level 2 or higher)

#### 3002 | **6.2.2.4 Association with Usage or Application**

3003 | Cryptographic information is used with a given cryptographic mechanism (e.g., digital  
3004 | signatures or [a](#) key establishment [scheme](#)) or with a particular application. Protection **shall** be  
3005 | provided to ensure that the information is not used incorrectly (e.g., not only must the usage or  
3006 | application be associated with the keying material, but the integrity of this association must be  
3007 | maintained). This protection can be provided by separating the cryptographic information from  
3008 | that of other mechanisms or applications, or by the use of appropriate metadata associated with  
3009 | the information. [Section 6.2.3](#), addresses the metadata associated with cryptographic  
3010 | information.

Deleted: Section 6.2.3

#### 3011 | **6.2.2.5 Association with the Other Entities**

3012 | Some cryptographic information needs to be correctly associated with another entity (e.g., the  
3013 | key source), and the integrity of this association **shall** be maintained. For example, a symmetric  
3014 | (secret) key used for the encryption of information, or the computation of a MAC needs to be  
3015 | associated with the other entity(ies) that [share\(s\)](#) the key. Public keys need to be correctly  
3016 | associated (e.g., cryptographically bound) with the owner of the key pair (e.g., using public-  
3017 | key certificates).

Deleted: shares

3018 | The cryptographic information **shall** retain its association during storage by separating the  
3019 | information by “entity” or application, or by using appropriate metadata for the information.  
3020 | [Section 6.2.3](#), addresses the metadata used for cryptographic information.

Deleted: Section 6.2.3

#### 3021 | **6.2.2.6 Association with Other Related Information**

3022 | An association may need to be maintained between protected information and the keying  
3023 | material that protected that information. In addition, keys may require association with other  
3024 | keying material (see [Section 6.2.1.6](#)).

Deleted: Section 6.2.1.6).

3025 | Storing the information together or providing some linkage or pointer between the information  
3026 | accomplishes the association. Often, the linkage between a key and the information it protects  
3027 | is accomplished by providing an identifier for a key, storing the identifier with the key in the  
3028 | key’s metadata, and storing the key’s identifier with the protected information. The association  
3029 | **shall** be maintained for as long as the protected information needs to be processed.

3030 | [Section 6.2.3](#), addresses the use of metadata for cryptographic information.

Deleted: Section 6.2.3

3039 **6.2.3 Metadata Associated with Cryptographic Information**

3040 Metadata may be used with cryptographic information to define the use of that information or  
3041 to provide a linkage between cryptographic information.

3042 **6.2.3.1 Metadata for Keys**

3043 Metadata is used to provide information about the key, including its parameters, or the  
3044 intended use of a key, and as such, contains the key’s control information. Different  
3045 applications may require different metadata elements for the same key type, and different  
3046 metadata elements may be required for different key types. It is the responsibility of an  
3047 implementer to select suitable metadata elements for keys. When metadata is used, the  
3048 metadata **should** accompany a key (i.e., the metadata is typically stored or transmitted with a  
3049 key). Some examples of metadata elements are:

- 3050 1. Key identifier;
  - 3051 2. Information identifying associated keys (e.g., the association between a public and  
3052 private key);
  - 3053 3. Identity of the key’s owner or the sharing entity(ies);
  - 3054 4. Cryptoperiod (e.g., the start date and end date);
  - 3055 5. Key type (e.g., a signing private key, encryption key, or master key);
  - 3056 6. Application (e.g., purchasing, email);
  - 3057 7. Sensitivity of the information protected by the key;
  - 3058 8. Counter<sup>46</sup>;
  - 3059 9. Domain parameters (e.g., the domain parameters used by DSA or ECDSA, or a pointer  
3060 to them);
  - 3061 10. Key state (e.g., pre-activation, active, destroyed);
  - 3062 11. Key status/history (e.g., distributed, revoked (with the revocation reason));
  - 3063 12. Key-wrapping key identifier and the algorithm used for wrapping;
  - 3064 13. Integrity-protection mechanism (e.g., the key and algorithm used to provide  
3065 cryptographic protection, and the protection code (e.g., MAC, digital signature)); and
  - 3066 14. Other information (e.g., the length of the key, any protection requirements, who has  
3067 access rights to the key, additional conditions for use).
- 3068 [SP800-152] provides additional information about the use of metadata, including guidance  
3069 about protecting its integrity and association with the related key.

3070 **6.2.3.2 Metadata for Related Cryptographic Information**

3071 Cryptographic information other than keying material may need metadata to “point to” the  
3072 keying material that was used to provide the cryptographic protection for the information. The  
3073 metadata may also contain other related cryptographic information. When metadata is used, the

## 3098 7 Key States and Transitions

3099 [\[Note to the reviewer: Please review this section carefully to see if it makes sense and is](#)  
3100 [clear.\]](#)

3101 A key may pass through several states between its generation and its destruction. [Figure 3](#)  
3102 [depicts an example of the key states that a key could assume and the transitions among them.](#)

**Figure 3: Key states and transitions.**

3108 A key is used differently, depending upon its state in the key’s lifecycle. Key states are defined  
3109 from a system point-of-view, as opposed to the point-of-view of a single cryptographic  
3110 module. The following sections discuss the states that an operational or backed-up key may  
3111 assume, along with transitions to other states, as shown in Figure 3. Additional states may be  
3112 applicable for some systems, and some of the identified states may not be needed for other  
3113 systems (e.g., if keys are to be activated immediately after generation, the pre-activation state  
3114 may not be needed, or a decision could be made that the suspended state will not be used).

3115 Transitioning between states often requires recording the event. Suitable places for such  
3116 recordings are audit logs and the key’s metadata (see Section 6.2.3.1). [SP800-152] also  
3117 discusses the logging of these events.

### 3118 7.1 Pre-activation State

3119 The key has been generated, but has not been authorized for use. In this state, the key may only  
3120 be used to perform proof-of-possession or key confirmation. Other than for proof-of-  
3121 possession (Section 8.1.5.1.1.2) or key-confirmation (Section 4.2.5.5) purposes, a key shall not  
3122 be used to apply cryptographic protection to information (e.g., encrypt or sign information to  
3123 be transmitted or stored) or to process cryptographically protected information (e.g., decrypt  
3124 ciphertext or verify a digital signature) while in this state.

3125  
3126 Transition 1: A key enters the pre-activation state immediately upon generation.

3127 Transition 2: If a key is in the pre-activation state, and it has been determined that the key  
3128 will not be needed in the future, the key shall transition directly from the pre-  
3129 activation state to the destroyed state.

3130 In the case of asymmetric keys, both keys of the key pair shall transition to the  
3131 destroyed state.

3132 The date and time of the transition shall be recorded.

3133 Transition 3: When a key is in the pre-activation state, and the integrity of the key or the  
3134 confidentiality of a key requiring confidentiality protection becomes suspect,  
3135 then the key shall transition from the pre-activation state to the compromised  
3136 state.

3137 In the case of asymmetric keys, both keys of the key pair shall transition to the  
3138 compromised state.

3139 The date and time of the transition shall be recorded. If the key is known by  
3140 multiple entities, a revocation notice shall be generated.

3141 Transition 4: Keys shall transition from the pre-activation state to the active state when the  
3142 key becomes available for use. This transition may occur upon reaching an  
3143 activation date or may occur because of an external event. In the case where  
3144 keys are generated for immediate use, this transition occurs immediately after  
3145 entering the pre-activation state.

3146 For certified asymmetric keys, both keys of the key pair become active upon the  
3147 notBefore date in the first certificate issued for the public key of the key pair.

**Deleted:** a key's

**Deleted:** Section 5.3).

## 3282 7.2 Active State

3283 The key may be used to cryptographically protect information (e.g., encrypt plaintext or  
 3284 generate a digital signature), to cryptographically process previously protected information  
 3285 (e.g., decrypt ciphertext or verify a digital signature) or both. When a key is active, it may be  
 3286 designated for protection only, processing only, or both protection and processing, depending  
 3287 on its type. For example, private signature keys and public key-transport keys are implicitly  
 3288 designated for only applying protection; public signature-verification keys and private key-  
 3289 transport keys are designated for processing only. A symmetric data-encryption key may be  
 3290 used to encrypt data during its originator-usage period and decrypt the encrypted data during  
 3291 its recipient-usage period (see Section 5.3.5).

**Moved (insertion) [6]**

3292 Transition 5: Several key types transition directly from the active state to the destroyed state  
 3293 if no compromise has been determined and either the key's cryptoperiod has  
 3294 been reached or the key has been replaced.

3295 Private signature keys and private authentication keys **shall** transition to the  
 3296 destroyed state at the end of their respective originator-usage periods (e.g.,  
 3297 when the *notAfter* dates are reached on the last certificate issued for the  
 3298 corresponding public keys). Note that the corresponding public keys transition  
 3299 to the deactivated state at this time; see transition 8.

3300 A symmetric RBG key **shall** transition to the destroyed state when replaced by a  
 3301 new key or when the RBG will no longer be used.

3302 Symmetric master keys and symmetric authorization keys **shall** transition to the  
 3303 destroyed state at the end of their respective originator-usage periods<sup>47</sup>.

3304 Private ephemeral key-agreement keys **shall** transition to the destroyed state  
 3305 immediately after use (see [SP800-56A]). The corresponding public ephemeral  
 3306 key-agreement keys **should** transition to the destroyed state when the  
 3307 corresponding private keys are destroyed<sup>48</sup>.

**Deleted:** An active key

3308 A private authorization key **shall** transition to the destroyed state at the end of  
 3309 its cryptoperiod (e.g., when the *notAfter* dates is reached on the last certificate  
 3310 issued for the corresponding public key). A public authorization key **should**  
 3311 transition to the destroyed state when the corresponding private key is  
 3312 destroyed<sup>49</sup>.

3313 The date and time of the transition **shall** be recorded.

<sup>47</sup> Recall that the recipient-usage periods of symmetric key-agreement keys and symmetric authorization keys are the same as their originator-usage periods (see Section 5.6).

<sup>48</sup> Recall that the cryptoperiods of the private and public authorization keys are the same (see Section 5.6).

<sup>49</sup> Recall that the cryptoperiods of the private and public authorization keys are the same (see Section 5.6).

3317 Transition 6: A key or key pair shall transition from the active state to the compromised state  
3318 when the integrity of the key or the confidentiality of a key requiring  
3319 confidentiality protection becomes suspect. In this case, the key or key pair  
3320 shall be revoked.

**Deleted:** a  
**Deleted:** Generally, keys are

3321 In the case of asymmetric key pairs, the compromise pertains explicitly to the  
3322 private key of the key pair, but both keys shall transition to the compromised  
3323 state. For example, when a private signature key or private key-transport key is  
3324 either compromised or suspected of being compromised, the corresponding  
3325 public key also needs to transition to the compromised state.

**Deleted:** when they are released to or determined by an unauthorized

3326 The date and time of the transition shall be recorded. If the key is known by  
3327 multiple entities, a revocation notice shall be generated.

3328 Transaction 7: A key or key pair shall transition from the active state to the suspended state if,  
3329 for some reason, the key is not to be used for a period of time. For example, a  
3330 key may be suspended because the entity associated with the key is on a leave  
3331 of absence.

**Deleted:** .

3332 In the case of asymmetric keys, both keys of the key pair shall transition to the  
3333 suspended state at the same time.

3334 Symmetric RBG keys shall transition to the compromised state and be replaced,  
3335 rather than suspended.

3336 The date, time and reason for the suspension shall be recorded. If the key or key  
3337 pair is known by multiple entities, a notification indicating the suspension and  
3338 reason shall be generated.

3339 Transition 8: A key or key pair in the active state shall transition to the deactivated state  
3340 when it is no longer to be used to apply cryptographic protection to data. The  
3341 transition to the deactivated state may be because a symmetric key was replaced  
3342 (see Section 8.2.3), because the end of the originator-usage cryptoperiod has  
3343 been reached (see Sections 5.3.4 and 5.3.5) or because the key or key pair was  
3344 revoked for reasons other than a compromise (e.g., the key's owner is no longer  
3345 authorized to use the key).

**Deleted:** 6: An

**Deleted:** key

**Deleted:** if

**Deleted:** and no longer intended to be used to process cryptographically protected data. A key shall transition from the active state to the deactivated state as a result of a revocation action (see Section 8.3.5) for a reason other than a key compromise, or if the key is replaced (see Section 8.2.3), or at the end of the key's cryptoperiod (see Sections 5.3.4 and 5.3.5).¶  
Transition 7: . Assuming that a key is not determined to be compromised while in the

3346 Symmetric authentication keys, symmetric data encryption/decryption keys,  
3347 symmetric key-agreement keys and key wrapping keys transition to the  
3348 deactivated state at the end of the key's originator-usage period.

**Deleted:** , a key should transition from the deactivated state to the destroyed state as soon as it is no longer needed

3349 Public signature verification keys, public authentication keys, and private/public  
3350 static key-agreement key pairs, transition to the deactivated state at the end of  
3351 the originator-usage period for the corresponding private key (e.g., when the  
3352 notAfter date is reached on the last certificate issued for the public key). Public  
3353 ephemeral key-agreement keys and public authorization keys transition to the  
3354 deactivated state if they have not been destroyed when the corresponding  
3355 private keys were destroyed (see transition 5).

**Deleted:** Transition 8: A deactivated

3356 A private and public key-transport key pair transitions to the deactivated state  
3357 when the notAfter date is reached on the last certificate issued for the public  
3358 key.

3382 The date and time of the transition **should** be recorded.

### 3383 **7.3 Suspended State**

3384 The use of a key or key pair may be suspended for several possible reasons; in the case of  
 3385 asymmetric key pairs, both the public and private keys **shall** be suspended at the same time.  
 3386 One reason for a suspension might be a possible key compromise, and the suspension has been  
 3387 issued to allow time to investigate the situation. Another reason might be that the entity that  
 3388 owns a digital signature key pair is not available (e.g., is on an extended leave of absence);  
 3389 signatures purportedly signed during the suspension time would be invalid.

3390 A suspended key or key pair may be restored to an active state at a later time or may be  
 3391 deactivated or destroyed, or may transition to the compromised state.

3392 A suspended key **shall not** be used to apply cryptographic protection (e.g., encrypt plaintext or  
 3393 generate a digital signature). However, a suspended key could be used to process information  
 3394 that was protected prior to the suspension (e.g., decrypt ciphertext or verify a digital signature),  
 3395 but the recipient must accept the risk in doing so (e.g., the recipient must understand the reason  
 3396 and implications of the suspension). For example, if the reason for the suspension is because of  
 3397 a suspected compromise, it may not be prudent to verify signatures using the public key unless  
 3398 the key pair is subsequently reactivated. Information for which protection is known to be  
 3399 applied during the suspension period **shall not** be processed until leaving the suspended state,  
 3400 at which time its processing depends on the new state.

3401 Transition 9: Several key types transition from the suspended state to the destroyed state if no  
 3402 compromise has been determined.

3403 Private signature keys and private authentication keys in the suspended state  
 3404 **shall** transition to the destroyed state at the end of their originator-usage periods  
 3405 (e.g., when the *notAfter* dates are reached on the last certificate issued for the  
 3406 corresponding public keys). Note that the corresponding public keys transition  
 3407 to the deactivated state at this time (see transition 12).

3408 Symmetric master keys and symmetric authorization keys in the suspended state  
 3409 **shall** transition to the destroyed state at the end of their originator-usage  
 3410 periods<sup>50</sup>.

3411 Private authorization keys in the suspended state **shall** transition to the  
 3412 destroyed state at the end of their originator-usage periods (i.e., when the  
 3413 *notAfter* dates are reached on the last certificate issued for the corresponding  
 3414 public keys). Public authorization keys **should** transition to the destroyed state  
 3415 when the corresponding private keys are destroyed<sup>51</sup>.

3416 The date and time of the transition **shall** be recorded.

3417 Transition 10: A key or key pair in the suspended state **shall** transition to the active state when  
 3418 the reason for the suspension no longer exists, and the end of the originator-  
 3419 usage period has not been reached.

<sup>50</sup> Recall that the recipient-usage periods of symmetric key-agreement keys and symmetric authorization keys are the same as their originator-usage periods (see Section 5.3.6).

<sup>51</sup> Recall that the cryptoperiods of the private and public authorization keys are the same (see Section 5.6).

[destroyed state would also be acceptable.](#)

3454 processing. Note that keys retrieved from an archive can be considered to be in the deactivated  
3455 state unless compromised.

3456 • Public signature verification keys may be used to verify the digital signatures generated  
3457 before the end of the private key's originator-usage period (e.g., before the *notAfter* date  
3458 in the last certificate for the public key).

3459 • Symmetric authentication keys, symmetric data encryption keys and symmetric key-  
3460 wrapping keys may be used to process cryptographically protected information until the  
3461 end of the recipient-usage period is reached, provided that the protection was applied  
3462 during the key's originator-usage period.

3463 • Public authentication keys may be used to authenticate processes performed before the  
3464 end of the corresponding private key's originator-usage period (e.g., before the *notAfter*  
3465 date in the last certificate for the public key).

3466 • Private key-transport keys may be used to decrypt keys that were encrypted using the  
3467 corresponding public key before the end of the public key's originator-usage period  
3468 (e.g., before the *notAfter* date in the last certificate for the public key).

3469 • Symmetric key-agreement keys may be used to determine the agreed-upon key,  
3470 assuming that sufficient information is available.

3471 • Private/public static key-agreement keys may be used to regenerate agreed-upon keys  
3472 that were created before the end of the key pair's cryptoperiod (e.g., before the *notAfter*  
3473 date in the last certificate for the public key, assuming that sufficient information is  
3474 available for the key-agreement scheme used).

3475 • Public ephemeral key-agreement keys may be used to regenerate agreed-upon keys  
3476 (assuming that sufficient information is available for the key-agreement scheme used).

3477 • Public authorization keys **shall not** be used.

3478 Keys in the deactivated state may transition to either the compromised or destroyed state at  
3479 some point in time.

3480 Transition 13: A key **shall** transition from the deactivated state to the compromised state when  
3481 the integrity of a key or the confidentiality of a key requiring confidentiality  
3482 protection becomes suspect. In this case, the key or key pair **shall** be revoked.

3483 The date, time and reason for the transition **shall** be recorded. If the key is  
3484 known by multiple entities, a revocation notice **shall** be generated.

3485 Transition 14: A key in the deactivated state **should** transition to the destroyed state as soon as  
3486 it is no longer needed.

3487 The date, time and reason for the transition **shall** be recorded.

3488 Note that keys retrieved from an archive may be in the deactivated state.

3489 **7.5 Compromised State**

3490 Generally, keys are compromised when they are released to or determined by an unauthorized  
3491 entity. A compromised key **shall not** be used to apply cryptographic protection to information.  
3492 However, in some cases, a compromised key or a public key that corresponds to a

**Deleted:** Generally, keys are compromised when they are released to or determined by an unauthorized entity

**Deleted:** 9

**Deleted:** compromised

**Moved (insertion) [7]**

**Deleted:** state when the key is no longer needed

3499 compromised private key of a key pair may be used to process cryptographically protected  
 3500 information. For example, a signature may be verified to determine the integrity of signed data  
 3501 if its signature has been physically protected since a time before the compromise occurred.  
 3502 This processing shall be done only under very highly controlled conditions, where the users of  
 3503 the information are fully aware of the possible consequences.

3504 Note that keys retrieved from an archive may be in the compromised state.

3505 Transition 15: A compromised key should transition to the destroyed state when its use will no  
 3506 longer be allowed or needed.

3507 The date and time of the transition shall be recorded.

### 3508 7.6 Destroyed State

3509 The key has been destroyed as specified in Section 8.3.4. Even though the key no longer exists  
 3510 when in this state, certain key metadata (e.g., key state transition history, key name, type, and  
 3511 cryptoperiod) may be retained (see Section 8.4).

3512 It is possible that a compromise of the destroyed key could be determined after the key has  
 3513 been destroyed. In this case, the compromise should be recorded.

## 3514 **8 Key-Management Phases and Functions**

3515 The cryptographic key-management lifecycle can be divided into four phases. During each  
 3516 phase, the keys are in certain specific key states as discussed in Section 7. In addition, within  
 3517 each phase, certain key-management functions are typically performed. These functions are  
 3518 necessary for the management of the keys and their associated metadata.

3519 Key-management information is called metadata. The metadata required for key management  
 3520 might include the identity of a person or system associated with that key or the types of  
 3521 information that person is authorized to access. Metadata is used by applications to select the  
 3522 appropriate cryptographic key(s) for a particular service. While the metadata does not appear in  
 3523 cryptographic algorithms, it is crucial to the implementation of applications and application  
 3524 protocols.

3525 The four phases of key management are specified below.

- 3526 1. **Pre-operational phase:** The keying material is not yet available for normal  
 3527 cryptographic operations. Keys may not yet be generated, or are in the pre-activation  
 3528 state. System or enterprise attributes are established during this phase, as well.
- 3529 2. **Operational phase:** The keying material is available and in normal use. Keys are in the  
 3530 active, suspended or deactivated state. Keys in the active state may be designated as  
 3531 protect only, process only, or protect and process; keys in the suspended or deactivated  
 3532 state can be used for processing only.
- 3533 3. **Post-operational phase:** The keying material is no longer in normal use, but access to  
 3534 the keying material is possible, and the keying material may be used for processing  
 3535 only in certain circumstances. Keys are in the deactivated or compromised states. Keys  
 3536 in the post-operational phase may be in an archive (see Section 8.3.1) when not  
 3537 processing data.

Deleted: 7.3 . States and Transitions for Asymmetric Keys¶

The preceding discussion of key states and transitions applies to both symmetric and asymmetric keys; however, some observations that are specific to asymmetric keys are in order.¶ Asymmetric keys that are or will be certified shall be in the pre-activation state until certified or until the “not before” date specified in a certificate has passed. The types of transitions for asymmetric keys depend on the key type. Examples of transitions follow:¶

<#>A private signature key shall not be retained in the deactivated state, but transition immediately to the destroyed state. ¶

<#>A private signature key transitioning from the active state to the compromised state shall not be retained in that state, but transition immediately to the destroyed-compromised state unless retention is required for legal purposes. ¶

<#>A public signature-verification key shall transition to the deactivated state at the end of the corresponding private key’s cryptoperiod. The public signature-verification key shall enter the compromised state if its integrity, or the confidentiality or integrity of its corresponding private signature key become suspect. However, public signature-verification keys need not be destroyed. ¶

<#>A private key-transport key transitions from the active state to the deactivated state when its corresponding public key is no longer to be used to apply cryptographic protection. The private key-transport key shall enter the compromised(...

Deleted: section 8.3.1)

3648 4. **Destroyed phase:** Keys are no longer available. Records of their existence may or may  
 3649 not have been deleted. Keys are in the destroyed states. Although the keys themselves  
 3650 are destroyed, the key metadata (e.g., key name, type, cryptoperiod, and usage period)  
 3651 may be retained (see [Section 8.4](#)).

- Deleted: or destroyed compromised
- Deleted: attributes
- Deleted: Section 8.4).
- Deleted: Figure 4.

3652 A flow diagram for the key management phases is presented in [Figure 4](#). Seven phase  
 3653 transitions are identified in the diagram. A key **shall not** be able to transfer back to any  
 3654 previous phase.

3655 Transition 1: A key is in the pre-  
 3656 operational phase upon generation  
 3657 (pre-activation state).

3658 Transition 2: If keys are produced, but  
 3659 never used, they may be destroyed  
 3660 by transitioning from the pre-  
 3661 operational phase directly to the  
 3662 destroyed phase.

3663 Transition 3: When a key in the pre-  
 3664 operational phase is compromised, it  
 3665 transitions to the post-operational  
 3666 phase (compromised state).

3667 Transition 4: After the required key  
 3668 metadata has been established,  
 3669 keying material has been generated,  
 3670 and the metadata is associated with  
 3671 the key during the pre-operational  
 3672 phase, the key is ready to be used by  
 3673 applications and transitions to the  
 3674 operational phase at the appropriate  
 3675 time.

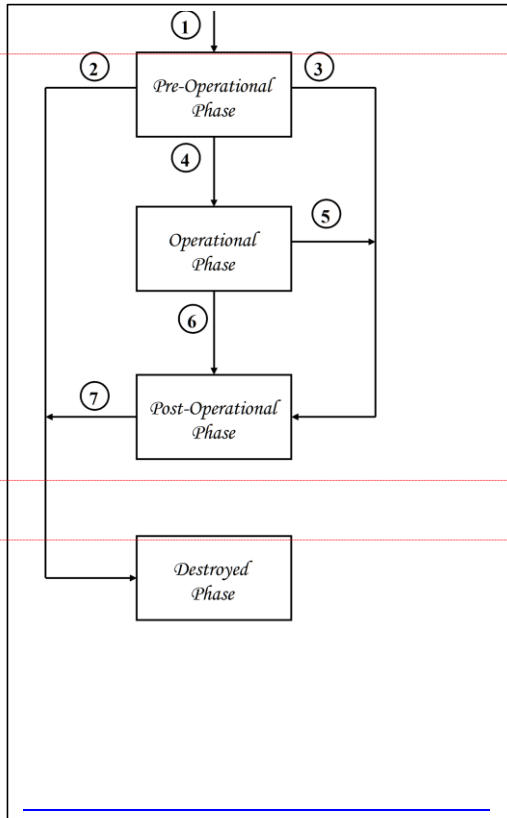

3676 Transition 5: When a key in the  
 3677 operational phase is compromised, it  
 3678 transitions to the post-operational  
 3679 phase (compromised state).

3680 Transition 6: When keys are no longer  
 3681 required for normal use (i.e., the end  
 3682 of the cryptoperiod has been reached and the key is no longer “active”), but access to  
 3683 those keys needs to be maintained, the key transitions to the post-operational phase.

3684 Transition 7: Some applications will require that access be preserved for a period of time,  
 3685 and then the keying material may be destroyed. When it is clear that a key in the post-  
 3686 operational phase is no longer needed, it may transition to the destroyed phase.

3687 The combination of key states and key phases is illustrated in [Figure 5](#). The pre-operational  
 3688 and destroyed phases contain only one state each, while the operational and post-operational  
 3689 phase have two states.

**Figure 4: Key management phases**

3708 | The following subsections discuss the  
 3709 | functions that are performed in each  
 3710 | phase of key management. A key-  
 3711 | management system may not have all  
 3712 | identified functions, since some  
 3713 | functions may not be appropriate. In  
 3714 | some cases, one or more functions may  
 3715 | be combined, or the functions may be  
 3716 | performed in a different order. For  
 3717 | example, a system may omit the  
 3718 | functions of the post-operational phase  
 3719 | if keys are immediately destroyed when  
 3720 | they are no longer used to apply  
 3721 | cryptographic protection or are  
 3722 | compromised. In this case, keys would  
 3723 | move from the operational phase  
 3724 | directly to the destroyed phase.

Deleted: 8.1.6.

Deleted: attributes

Deleted: /

Deleted: these attributes

3725 | **8.1 Pre-operational Phase**

3726 | During the pre-operational phase of key  
 3727 | management, keying material is not yet  
 3728 | available for normal cryptographic  
 3729 | operations.

3730 | **8.1.1 User Registration Function**

3731 | During user registration, an entity interacts with a registration authority to become an  
 3732 | authorized member of a security domain. In this phase, a user identifier or device name may be  
 3733 | established to identify the member during future transactions. In particular, security  
 3734 | infrastructures may associate the identification information with the entity's keys (see Sections  
 3735 | 8.1.5 and 8.1.6). The entity may also establish various information during the registration  
 3736 | function, such as email addresses, or role, and authorization information. As with identity  
 3737 | information, this information may be associated with the entity's keys by the infrastructure to  
 3738 | support secure application-level security services.

3739 | Since applications will depend upon the identity established during this process, it is crucial  
 3740 | that the registration authority establish appropriate procedures for the validation of identity.  
 3741 | Identity may be established through an in-person appearance at a registration authority, or may  
 3742 | be established entirely out-of-band. Human entities are usually required to provide credentials  
 3743 | (e.g., an identification card or birth certificate), while system entities are vouched for by those  
 3744 | individuals responsible for system operation. The strength (or weakness) of a security  
 3745 | infrastructure will often depend upon the identification process.

3746 | User and key registration (see Section 8.1.6) may be performed separately, or in concert. If  
 3747 | performed separately, the user registration process will generally establish a secret value (e.g.,  
 3748 | a password, PIN, or HMAC key); the secret value may be used to authenticate the user's  
 3749 | identity during the key registration step. If performed in concert, the user establishes an  
 3750 | identity and performs key registration in the same process, so the secret value is not required.

3763 **8.1.2 System Initialization Function**

3764 System initialization involves setting up or configuring a system for secure operation. This  
3765 may include algorithm preferences, the identification of trusted parties, and the definition of  
3766 domain-parameter policies and any trusted parameters (e.g., recognized certificate policies).

3767 **8.1.3 User Initialization Function**

3768 User initialization consists of an entity initializing its cryptographic application (e.g., installing  
3769 and initializing software or hardware). This involves the use or installation (see [Section 8.1.4](#))  
3770 of the initial keying material that may be obtained during user registration. Examples include  
3771 the installation of a key at a CA, trust parameters, policies, trusted parties, and algorithm  
3772 preferences.

Deleted: Section 8.1.4)

3773 **8.1.4 Keying-Material Installation Function**

3774 The security of keying-material installation is crucial to the security of a system. For this  
3775 function, keying material is installed for operational use within an entity’s software, hardware,  
3776 system, application, cryptographic module, or device using a variety of techniques. Keying  
3777 material is installed during initial set up, when new keying material is added to the existing  
3778 keying material, and when existing keying material is replaced (e.g., via re-keying or key  
3779 derivation – see [Sections 8.2.3](#) and [8.2.4](#)).

Deleted: when the software, hardware, system, application, cryptographic module, or device is initially

Deleted: , key update,

Deleted: -

Deleted: Section 8.2.3

Deleted: Section 8.2.4).

Deleted: [FIPS140]

3780 The process for the initial installation of keying material (e.g., by manual entry, electronic key  
3781 loader, or a vendor during manufacture) **shall** include the protection of the keying material  
3782 during entry into a software/hardware/system/application/device/cryptographic module, taking  
3783 into account the requirements of [\[FIPS140\]](#), and its differing requirements for the different  
3784 levels of protection, and include any additional procedures that may be required.

3785 Many applications or systems are provided by the manufacturer with keying material that is  
3786 used to test that the newly installed application/system is functioning properly. This test keying  
3787 material **shall not** be used operationally.

3788 **8.1.5 Key Establishment Function**

3789 Key establishment involves the generation and distribution, or the agreement of keying  
3790 material for communication between entities. All keys **shall** be generated within a FIPS140-  
3791 validated cryptographic module or obtained from another source approved by the U.S.  
3792 Government for the protection of national security information. During the key-establishment  
3793 process, some of the keying material may be in transit (i.e., the keying material is being  
3794 manually distributed or is being distributed using automated protocols). Other keying material  
3795 may be retained locally. In either case, the keying material **shall** be protected in accordance  
3796 with [Section 6](#).

Deleted: Section 6.

3797 An entity may be an individual (person), organization, device or process. When keying  
3798 material is generated by an entity for its own use, one or more of the appropriate protection  
3799 mechanisms for stored information in [Section 6.2.2](#) **shall** be used.

Deleted: and the keying material is not distributed among “sub-entities” (e.g., is not distributed among various individuals, devices or processes within an organization),

Deleted: Section 6.2.2

Deleted: .

Deleted: Section 6.2.1.

3800 Keying material that is distributed between entities, or among an entity and its sub-entities,  
3801 (e.g., various individuals, devices or processes within an organization), **shall** be protected  
3802 during distribution using one or more of the appropriate protection mechanisms specified in  
3803 [Section 6.2.1](#). Any keying material that is not distributed (e.g., the private key of a key pair, or  
3804 one’s own copy of a symmetric key) or keying material that is received and subsequently stored

3822 shall be protected using one or more of the appropriate protection mechanisms specified in  
3823 [Section 6.2.2](#).

Deleted: Section 6.2.2.

3824 [\[SP800-133\] discusses the generation of keying material.](#)

3825 **8.1.5.1 Generation and Distribution of Asymmetric Key Pairs**

3826 Key pairs shall be generated in accordance with the mathematical specifications of the  
3827 appropriate approved [FIPS](#) or NIST Recommendation.

Deleted: Standard

3828 A static key pair shall be generated by the entity that “owns” the key pair (i.e., the entity that  
3829 uses the private key in the cryptographic computations), or by a facility that distributes the key  
3830 pair in accordance with [Section 8.1.5.1.3](#), or by the user and facility in a cooperative process.

Deleted: Section 8.1.5.1.3,

3831 When generated by the entity that owns the key pair, a signing private key shall not be  
3832 distributed to other entities. In the case of a public signature-verification key and its associated  
3833 private key, the owner should generate the keying material, rather than any other entity  
3834 generating the keying material for that owner; this will facilitate [the support for non-](#)  
3835 [repudiation. However, when the owner is an organization, it is acceptable to distribute the](#)  
3836 [keying material to the organization's sub-entities \(e.g., employees or devices\); in this case, the](#)  
3837 [organization is the true owner, and the sub-entities represent the owner.](#)

Deleted: non-repudiation

3838 Ephemeral keys are often used for key establishment (see [\[SP800-56A\]](#)). They are generated  
3839 for each new key-establishment [transaction](#) (e.g., unique to each message or session).

Deleted: [SP800-56A].

Deleted: process

3840 The generated key pairs shall be protected in accordance with [Section 6.1.1](#).

Deleted: Section 6.1.1.

3841 **8.1.5.1.1 Distribution of Static Public Keys**

3842 Static public keys are relatively long-lived and are typically used for a number of executions of  
3843 an algorithm. The distribution of the public key should provide assurance to the receiver of [the](#)  
3844 [public](#) key that the true owner of the key is known (i.e., the claimed owner is the actual owner);  
3845 this requirement may be disregarded if anonymity is acceptable. However, the strength of the  
3846 overall architecture and trust in the validity of the protected data depends, in large part, on the  
3847 assurance of the public-key owner’s identity.

Deleted: that

3848 In addition, the distribution of the public key shall provide assurance to the receiver that:

- 3849 1. The purpose/usage of the key is known (e.g., [for](#) RSA digital signatures or elliptic-  
3850 curve key agreement),
- 3851 2. Any parameters associated with the public key are known (e.g., domain parameters),
- 3852 3. The public key is valid (e.g., the public key satisfies the required arithmetical  
3853 properties), and
- 3854 4. The owner actually possesses the corresponding private key.

3855 **8.1.5.1.1.1 Distribution of a Trust Anchor's Public Key in a PKI**

3856 The public key of a [trusted](#) Certification Authority is the foundation for all PKI-based security  
3857 services; [the trusted CA is considered to be a trust anchor.](#) The trust [anchor's public key](#) is not a  
3858 secret, but the *authenticity* of [that public key](#) is the crucial assumption for PKI. Trust [anchor](#)  
3859 [public keys](#) may be obtained through many different mechanisms, providing different levels of  
3860 assurance. The types of mechanisms that are provided may depend on the role of the user in the  
3861 infrastructure. A user that is only a “relying party” – that is, a user that does not have keys

Deleted: .

Deleted: anchor

Deleted: the trust anchor

Deleted: anchors

3874 registered with the infrastructure – may use different mechanisms than a user that possesses  
3875 keys registered by the infrastructure.

3876 Trust [anchor public keys](#) are frequently distributed as "self-signed" X.509 certificates, that is,  
3877 certificates that are signed by the private key corresponding to the [public key in the certificate](#).  
3878 [Note that, while this document refers to a trusted CA as the "trust anchor" and its certificate as](#)  
3879 [the "trust anchor certificate," many other documents use the term "trust anchor" to refer to both](#)  
3880 [the trusted CA and the CA's certificate.](#)

Deleted: anchors  
Deleted: subject public key of the certificate.

3881 Trust [anchor certificates](#) are often embedded within an application and distributed with the  
3882 application. For example, the installation of a new web browser typically includes the  
3883 installation or replacement of the user's [list of trust anchor certificates](#). Operating systems [are](#)  
3884 often shipped with "code signing" trust anchor [certificates](#). The user relies upon the  
3885 authenticity of the software distribution mechanism to ensure that only valid trust [anchor](#)  
3886 [certificates](#) are installed during installation or replacement. However, in some cases other  
3887 applications may install trust anchor [certificates](#) in web browsers.

Deleted: anchors  
Deleted: list  
Deleted: are  
Deleted: public keys  
Deleted: anchors  
Deleted: keys  
Deleted: anchors

3888 Trust [anchor certificates](#) in web browsers are used for several purposes, including the  
3889 validation of S/MIME e-mail certificates and web server certificates for "secure websites" that  
3890 use the TLS protocol to authenticate the web server and provide confidentiality. Users who  
3891 visit a "secure" website that has a certificate not issued by a trust anchor CA may be given an  
3892 opportunity to accept that certificate, either for a single session or permanently. **Relying users**  
3893 **should be cautious about accepting certificates from unknown Certification Authorities**  
3894 **so that they do not, in effect, inadvertently add new permanent trust [anchor certificates](#)**  
3895 **that are [really](#) not trustworthy.**

Deleted: anchors

3896 **Warning:** Roaming users **should** be aware that they are implicitly trusting all software on the  
3897 host systems that they use. They should have concerns about trust [anchor certificates](#) used by  
3898 web browsers when they use systems in kiosks, libraries, Internet cafes, or hotels, [as well as](#)  
3899 systems provided by conference organizers to access "secure websites." The user has had no  
3900 control over the trust [anchor certificates](#) installed in the host system, and therefore [the user](#) is  
3901 relying upon the host systems to have made good, sensible decisions about which trust [anchor](#)  
3902 [certificates](#) are allowed; relying parties are not participants in trust anchor [certificate](#) selection  
3903 when the trust [anchor certificates](#) are pre-installed prior to software distribution, and may have  
3904 had no part in decisions about which trust [anchor certificates](#) are installed thereafter. The user  
3905 should be aware that he is trusting the software distribution mechanism to avoid the installation  
3906 of malicious code. Extending this trust to cover trust [anchor certificates](#) for a given application  
3907 may be reasonable, and allows the relying party to obtain trust [anchor certificates](#) without any  
3908 additional procedures.

3909 [When](#) a user registers keys with an infrastructure, additional mechanisms are usually available.  
3910 The user interacts securely with the infrastructure to register its keys (e.g., to obtain  
3911 certificates), and these interactions may be extended to provide trust anchor information, [in the](#)  
3912 [form of a trust anchor certificate](#). This allows the user to establish trust anchor [certificates](#) with  
3913 approximately the same assurance that the infrastructure has in the user's keys. In the case of a  
3914 PKI:

Deleted: Where  
Deleted: .  
Deleted: information

3915 1. The initial distribution of a trust anchor [certificate](#) **should** be performed in conjunction  
3916 with the presentation of a requesting entity's public key to a registration authority (RA)  
3917 or CA during the certificate request process. In general, the trust anchor's public key,

Deleted: the public key of

3941 associated parameters, key use, and assurance of possession are conveyed as a self-  
3942 signed X.509 public-key certificate. In this case, the certificate has been digitally signed  
3943 by the private key that corresponds to the public key within the certificate. While the  
3944 parameters and assurance of possession may be conveyed in the self-signed certificate,  
3945 the identity associated with the trust anchor certificate and other information cannot be  
3946 verified from the self-signed certificate itself (see item 2 below).

**Deleted:** trust anchor's

3947 2. The trusted process used to convey a requesting entity's public key and assurances to  
3948 the RA or CA **shall** also be used to protect the trust anchor's certificate that is conveyed  
3949 to the requesting entity. In cases where the requesting entity appears in person, the trust  
3950 anchor's certificate may be provided at that time. If a secret value has been established  
3951 during user registration (see Section 8.1.1), the trust anchor's certificate may be  
3952 supplied, along with the requesting entity's certificate.

**Deleted:** anchor information

**Deleted:** anchor information

**Deleted:** Section 8.1.1),

**Deleted:** anchor information

3953 **8.1.5.1.1.2 Submission to a Registration Authority or Certification Authority**

3954 Public keys may be provided to a Certification Authority (CA) or to a registration authority  
3955 (RA) for subsequent certification by a CA. During this process, the RA or CA **shall** obtain the  
3956 assurances listed in Section 8.1.5.1.1, from the owner of the key or an authorized representative  
3957 (e.g., the firewall administrator), including the owner's identity.

**Deleted:** Section 8.1.5.1.1

3958 In general, the owner of the key is identified in terms of an identifier established during user  
3959 registration (see Section 8.1.1). The key owner identifies the appropriate uses for the key,  
3960 along with any required parameters. In cases where anonymous ownership of the public key is  
3961 acceptable, the owner or the registration authority determines a pseudonym to be used as the  
3962 identifier. The identifier **shall** be unique for the naming authority<sup>53</sup>.

**Deleted:** Section 8.1.1).

**Deleted:** the

**Deleted:** and any assurances of validity and possession

3963 Proof of Possession (POP) is a mechanism that is commonly used by a CA to obtain assurance  
3964 of private-key possession during key registration. In this case, the proof **shall** be provided by  
3965 the reputed owner of the key pair. Without assurance of possession, it would be possible for the  
3966 CA to bind the public key to the wrong entity.

3967 The (reputed) owner **should** provide POP by performing operations with the private key that  
3968 satisfy the indicated key use. For example, if a key pair is intended for RSA digital signature  
3969 generation, the CA may provide information to be signed using the owner's private key. If the  
3970 owner can correctly verify the signature using the corresponding public key, then the owner  
3971 has established POP. However, when a key pair is intended to support key establishment, (i.e.,  
3972 either key agreement or key transport), POP may also be afforded by using the private key to  
3973 digitally sign the certificate request (although this is not the preferred method). The private  
3974 key-establishment key (i.e., the private key-agreement or private key-transport key) **shall not**  
3975 be used to perform signature operations after certificate issuance.

**Deleted:** to support

**Deleted:** ciphertext key

**Deleted:** associated private key and then provide evidence that the key was correctly decrypted (e.g., by encrypting a random challenge from the CA),

**Deleted:** .

3976 As with user registration, the strength of the security infrastructure depends upon the methods  
3977 used for distributing the key to an RA or CA. There are many different methods, each  
3978 appropriate for some range of applications. Some examples of common methods are:

<sup>53</sup> The naming authority is the entity responsible for the allocation and distribution of domain names, ensuring that the names are unique within the domain. A naming authority is often restricted to a particular level of domains, such as .com, .net or .edu.

- 3999 | 1. The public key and the information identified in [Section 8.1.5.1.1](#), are provided [in](#)  
4000 | [person](#) by the public-key owner in person, or by an authorized representative of the  
4001 | public-key owner.
- 4002 | 2. The identity of the public-key owner or an authorized representative of the public-key  
4003 | owner (i.e., a person, organization, device or process) is established at the RA or CA in  
4004 | person during user registration. Unique, unpredictable information (e.g., an  
4005 | authenticator or cryptographic key) is provided at this time by the RA or CA to the  
4006 | owner or authorized representative as a secret value. The public key and the  
4007 | information identified in [Section 8.1.5.1.1](#), are provided to the RA or CA using a  
4008 | communication protocol protected by the secret value. The secret value **should** be  
4009 | destroyed by the key owner as specified in [Section 8.3.4](#), upon receiving confirmation  
4010 | that the certificate has been successfully generated. The RA or CA may maintain this  
4011 | secret value for auditing purposes, but the RA or CA **should not** accept further use of  
4012 | the secret value to prove identity.
- 4013 | When a specific list of public-key owners are pre-authorized to register keys, identifiers  
4014 | may be assigned without the owners being present. In this case, it is critical to protect  
4015 | the secret [values](#) from disclosure, and the procedures **shall** demonstrate that the chain  
4016 | of custody was maintained. The [lifetime of the secret values](#) **should** be limited, but  
4017 | **shall** allow for the public-key owner to appear at the RA or CA, [to](#) generate his keys,  
4018 | and [to](#) provide the public key (under the secret value's protection) to the RA or CA.  
4019 | Since it may take some time for the public-key owner to appear at the RA or CA, a two  
4020 | or three-week lifetime for the secret value is probably reasonable.
- 4021 | When public-key owners are not pre-authorized, the RA or CA **shall** determine the  
4022 | identifier in the user's presence. In this case, the time limit may be much more  
4023 | restrictive, since the public-key owner need only generate his keys and provide the  
4024 | public key to the CA or RA. In this case, a 24-hour lifetime for the secret value would  
4025 | be reasonable.
- 4026 | 3. The identity of the public-key owner is established at the RA or CA using a previous  
4027 | determination of the public-key owner's identity. This is accomplished by "chaining" a  
4028 | new public-key certificate request to a previously certified digital-signature key pair.  
4029 | For example, the request for a new public-key certificate is signed by the owner of the  
4030 | new public key to be certified. The private signature key used to sign the request  
4031 | **should** [correspond to](#) a public signature-verification key that is certified by the same  
4032 | CA that will certify the new public key. The request contains the new public key and  
4033 | any key-related information (e.g., [the](#) key use and [the key's](#) parameters). In addition, the  
4034 | CA **shall** obtain assurance of public-key validity and assurance that the owner  
4035 | possesses the [corresponding](#) private key.
- 4036 | 4. The public key, key use, parameters, validity assurance information, and assurance of  
4037 | possession are provided to the RA or CA, along with a claimed identity. The RA or CA  
4038 | delegates the verification of the public-key owner's identity to another trusted process  
4039 | (e.g., an examination of the public-key owner's identity by the U.S. Postal Service  
4040 | when delivering registered mail containing the requested certificate). Upon receiving a  
4041 | request for certification, the RA or CA generates and sends unique, unpredictable  
4042 | information (e.g., an authenticator or cryptographic key) to the requestor using a trusted

**Deleted:** Section 8.1.5.1.1

**Deleted:** in person

**Deleted:** Section 8.1.5.1.1

**Deleted:** Section 8.3.4

**Deleted:** value

**Deleted:** secret value's

**Deleted:** be associated with

**Deleted:** associated

4051 process (e.g., registered mail sent via the U.S. Postal Service). The trusted process  
4052 assures that the identity of the requestor is verified prior to delivery of the information  
4053 provided by the RA or CA. The owner uses this information to prove that the trusted  
4054 process succeeded, and the RA or CA subsequently delivers the certificate to the owner.  
4055 The unique, unpredictable information **should** be destroyed by the key owner as  
4056 specified in Section 8.3.4, upon receiving confirmation that the certificate has been  
4057 successfully generated. (The RA or CA may maintain this information for auditing  
4058 purposes, but **should not** accept further use of the unique identifier to prove identity.)

Deleted: Section 8.3.4

4059 In cases involving an RA, upon receipt of all information from the requesting entity (i.e., the  
4060 owner of the new public key), the RA forwards the relevant information to a CA for  
4061 certification. The RA and CA, in combination, **shall** perform any validation or other checks  
4062 required for the algorithm with which the public key will be used (e.g., public-key validation)  
4063 prior to issuing a certificate. The CA **should** indicate the checks or validations that have been  
4064 performed (e.g., in the certificate, or in the certificate policy or certification practice  
4065 statement). After generation, the certificate is distributed manually or using automated  
4066 protocols to the RA, the public-key owner, or a certificate repository (i.e., a directory) in  
4067 accordance with the CA's certification practice statement.

4068 **8.1.5.1.1.3 General Distribution**

4069 Public keys may be distributed to entities other than an RA or CA in several ways. Distribution  
4070 methods include:

4071 1. Manual distribution of the public key itself by the owner of the public key (e.g., in a  
4072 face-to-face transfer or by a bonded courier); the mandatory assurances listed in Section  
4073 8.1.5.1.1, **shall** be provided to the recipient prior to the use of the public key  
4074 operationally.

Deleted: Section 8.1.5.1.1

4075 2. Manual (e.g., in a face-to-face transfer or by receipted mail) or automated distribution  
4076 of a public-key certificate by the public-key owner, the CA, or a certificate repository  
4077 (i.e., a directory). The mandatory assurances listed in Section 8.1.5.1.1, that are not  
4078 provided by the CA (e.g., public-key validation) **shall** be provided to or performed by  
4079 the receiver of the public key prior to the use of the key operationally.

Deleted: 8.1.5.1.1

4080 3. Automated distribution of a public key (e.g., using a communication protocol with  
4081 authentication and content integrity). The mandatory assurances listed in Section  
4082 8.1.5.1.1, **shall** be provided to the receiving entity prior to the use of the public key  
4083 operationally.

Deleted: ) in which a certified key pair owned by the entity distributing the public key protects the public key being distributed.

Deleted: Section 8.1.5.1.1

4084 **8.1.5.1.2 Distribution of Ephemeral Public Keys**

4085 When used, ephemeral public keys are distributed as part of a secure key-agreement protocol.  
4086 The key-agreement process (i.e., the key-agreement scheme + the protocol + key confirmation  
4087 + any associated negotiation + local processing) **should** provide a recipient with the assurances  
4088 listed in Section 8.1.5.1.1. The recipient of an ephemeral public key **shall** obtain assurance of  
4089 validity of that key as specified in [SP800-56A] prior to using that key for subsequent steps in  
4090 the key-agreement process.

Deleted: Section 8.1.5.1.1.

Deleted: [SP800-56A] or [SP800-56B]

4100 **8.1.5.1.3 Distribution of Centrally Generated Key Pairs**

4101 When a static key pair is centrally generated, the key pair **shall** be generated within a FIPS140-  
4102 validated cryptographic module or obtained from another source approved by the U.S.  
4103 government for protecting national security information for subsequent delivery to the intended  
4104 owner of the key pair. A signing key pair generated by a central key-generation facility for its  
4105 subscribers will not provide strong support for non-repudiation for those individual  
4106 subscribers; therefore, when support for non-repudiation is required by those subscribers, the  
4107 subscribers **should** generate their own signing key pairs. However, if the central key-  
4108 generation facility generates signing key pairs for its own organization and distributes them to  
4109 members of the organization, then support for non-repudiation may be provided at an  
4110 organizational level (but not an individual level).

4111 The private key of a key pair generated at a central facility **shall** only be distributed to the  
4112 intended owner of the key pair. The confidentiality of the centrally generated private key **shall**  
4113 be protected, and the procedures for distribution **shall** include an authentication of the  
4114 recipient's identity as established during user registration (see Section 8.1.1).

4115 The key pair may be distributed to the intended owner using an appropriate manual method  
4116 (e.g., courier, mail or other method specified by the key-generation facility) or secure  
4117 automated method (e.g., a secure communication protocol). The private key **shall** be  
4118 distributed in the same manner as a symmetric key (see Section 8.1.5.2.2). During the  
4119 distribution process, each key of the key pair **shall** be provided with the appropriate protections  
4120 for that key (see Section 6.1).

4121 When split-knowledge procedures are used for the manual distribution of the private key, the  
4122 key **shall** be split into multiple key components that have the same security properties as the  
4123 original key (e.g., randomness); each key component **shall** provide no knowledge of the value  
4124 of the original key (e.g., each key component **shall** appear to be generated randomly).

4125 Upon receipt of the key pair, the owner **shall** obtain assurance of the validity of the public key  
4126 (see [SP800-56A], [SP800-56B] and [SP800-89]). The owner **shall** obtain assurance that the  
4127 public and private keys of the key pair are correctly associated (i.e., check that they are a  
4128 consistent pair, for example, by checking that a key encrypted under a public key-transport key  
4129 can be decrypted by the private key-transport key).

4130 **8.1.5.2 Generation and Distribution of Symmetric Keys**

4131 The symmetric keys used for the encryption and decryption of data or other keys and for the  
4132 computation of MACs (see Sections 4.2.2 and 4.2.3) **shall** be determined by an **approved**  
4133 method and **shall** be provided with protection that is consistent with Section 6.

4134 Symmetric keys **shall** be either:

- 4135 1. Generated and subsequently distributed (see Sections 8.1.5.2.1 and 8.1.5.2.2) either  
4136 manually (see Section 8.1.5.2.2.1), using a public key-transport mechanism (see  
4137 Section 8.1.5.2.2.2), or using a previously distributed or agreed-upon key wrapping key  
4138 (see Section 8.1.5.2.2.2),
- 4139 2. Established using a key-agreement scheme (i.e., the generation and distribution are  
4140 accomplished with one process) (see Section 8.1.5.2.3), or
- 4141 3. Derived from a master key (see Section 8.2.4).

Deleted: Section 8.1.1).

Deleted: Section 8.1.5.2.2.2),

Deleted: Section 8.1.5.2.3),

Deleted: 3. Determined by a key-update process (see Section 8.2.3.2), or¶  
4

Deleted: Section 8.2.4).

4160 **8.1.5.2.1 Key Generation**

4161 Symmetric keys determined by key generation methods **shall** be either generated by an  
4162 **approved** method (e.g., using an **approved** random number generator), or derived from a  
4163 master key (see [Section 8.2.4](#)) using an **approved** key-derivation function (see [\[SP800-108\]](#)).  
4164 Also, see [\[SP800-133\]](#).

4165 When split-knowledge procedures are used, the key **shall** exist outside of a [\[FIPS140\]](#),  
4166 cryptographic module as multiple key components. The keying material may be created within  
4167 a cryptographic module and then split into components for export from the module, or may be  
4168 created as separate components. Each key component **shall** provide no knowledge of the key  
4169 value (e.g., each key component must appear to be generated randomly). If knowledge of  $k$   
4170 components is required to construct the original key, then knowledge of any  $k-1$  key  
4171 components **shall** provide no information about the original key other than, possibly, its length.  
4172 Note: A suitable combination function is not provided by simple concatenation; e.g., it is not  
4173 acceptable to form a 128-bit key by concatenating two 64-bit key components.

4174 All keys and key components **shall** be generated within a [FIPS 140](#)-validated cryptographic  
4175 module or obtained from another source approved by the U.S. Government for the protection  
4176 of national security information.

4177 **8.1.5.2.2 Key Distribution**

4178 Keys generated in accordance with [Section 8.1.5.2.1](#), as key-wrapping keys (i.e., key-  
4179 encrypting keys), as master keys to be used for key derivation, or for the protection of  
4180 communicated information are distributed manually (manual key transport) or using an  
4181 automated key-transport protocol (automated key transport).

4182 Keys used only for the storage of information (i.e., data or keying material) **shall not** be  
4183 distributed except for backup or to other authorized entities that may require access to the  
4184 [stored](#) information protected by the keys.

4185 **8.1.5.2.2.1 Manual Key Distribution**

4186 Keys distributed manually (i.e., by other than an automated key-transport protocol) **shall** be  
4187 protected throughout the distribution process. During manual distribution, secret or private  
4188 keys **shall** either be wrapped (i.e., encrypted) or be distributed using appropriate physical  
4189 security procedures. If multi-party control is desired, split knowledge procedures may be used  
4190 as well. The manual distribution process **shall** assure that:

- 4191 1. The distribution of [the](#) keys is from an authorized source,
- 4192 2. Any entity distributing plaintext keys is trusted by both the entity that generates the  
4193 keys and the entity(ies) that receives the keys,
- 4194 3. The keys are protected in accordance with [Section 6](#), and
- 4195 4. The keys are received by the authorized recipient.

4196 When distributed in encrypted form, the key **shall** be encrypted by an **approved** key-wrapping  
4197 scheme using a key-wrapping key that is used only for key wrapping, or by an **approved** key-  
4198 transport scheme using a public key-transport key owned by the intended recipient. The key-  
4199 wrapping key or public key-transport key **shall** have been distributed as specified in this  
4200 Recommendation.

Deleted: Section 8.1.5.2.1

Deleted: as the initial key for key update,

Deleted: Section 6,

4214 When using split knowledge procedures, each key component **shall** be either encrypted or  
4215 distributed separately to each individual. Appropriate physical security procedures **shall** be  
4216 used to protect each key component as sensitive information.

4217 Physical security procedures may be used for all forms of manual key distribution. However,  
4218 these procedures are particularly critical when the keys are distributed in plaintext form. In  
4219 addition to the assurances listed above, accountability and auditing of the distribution process  
4220 (see Sections [9.1](#) and [9.2](#)) **should** be used.

4221 **8.1.5.2.2 Automated Key Distribution/Key Transport/Key Wrapping**

4222 Automated key distribution, [also known as](#) key transport [or key wrapping](#), is used to distribute  
4223 keys via a communication channel (e.g., the Internet or a satellite transmission). [This](#) requires  
4224 the prior distribution of a key-wrapping key (i.e., a key-encryption key) or a public key-  
4225 transport key as follows:

4226 1. A key-wrapping key **shall** be generated and distributed in accordance with Sections  
4227 [8.1.5.2.1](#) and [8.1.5.2.2](#), or established using a key-agreement scheme as defined in  
4228 [Section 8.1.5.2.3](#).

4229 2. A public key-transport key **shall** be generated and distributed as specified in [Section](#)  
4230 [8.1.5.1](#).

4231 Only **approved** key-wrapping or public key-transport schemes **shall** be used. The **approved**  
4232 schemes provide assurance that:

4233 a. For symmetric key-wrapping schemes: The key-wrapping key and the distributed key  
4234 are not disclosed or modified. [Approved key-wrapping algorithms are provided in](#)  
4235 [\[SP800-38F\]. Note that in this case, key encryption alone, as discussed in Section](#)  
4236 [4.2.5.4, does not provide protection against modification; an additional integrity](#)  
4237 [mechanism must be used \(e.g., by using an authenticated encryption mode\).](#)

4238 b. For [asymmetric](#) key-transport schemes: The private key-transport key and the  
4239 distributed key are not disclosed or modified, and correct association between the  
4240 private and public key-transport keys is maintained. [Approved key-transport schemes](#)  
4241 [using asymmetric techniques are provided in \[SP800-56A\] and \[SP800-56B\].](#)

4242 c. The keys are protected in accordance with [Section 6](#).

4243 In addition, the **approved** schemes, together with the associated key-establishment protocol,  
4244 **should** provide the following assurances:

4245 d. Each entity in the key-[distribution](#) process knows the identifier associated with the  
4246 other entity(ies),

4247 e. The keys are correctly associated with the entities involved in the key-[distribution](#)  
4248 process, and

4249 f. The keys have been received correctly.

4250 **8.1.5.2.3 Key Agreement**

4251 Key agreement is used in a communication environment to establish keying material using  
4252 information contributed by all entities in the communication (most commonly, only two  
4253 entities) without actually sending the keying material. Only **approved** key-agreement schemes

Deleted: 9.1

Deleted: Section 8.1.5.1.

Deleted: key

Deleted: key-transport

Deleted: public

Deleted: Section 6.

Deleted: key-transport

Deleted: transport

Deleted: transport

4269 **shall** be used. **Approved** key-agreement schemes using asymmetric techniques are provided in  
4270 [\[SP800-56A\]](#) and [\[SP800-56B\]](#). Key agreement uses asymmetric key pairs to calculate shared  
4271 secrets, which are then used to derive symmetric keys and other keying material (e.g., IVs).

4272 A key-agreement scheme uses either static or ephemeral **asymmetric** key pairs or both. The  
4273 asymmetric key pairs **should** be generated and distributed as discussed in [Section 8.1.5.1](#).  
4274 Keying material derived from a key-agreement scheme **shall** be protected as specified in  
4275 [Section 6](#).

4276 A key-agreement scheme and its associated key-establishment protocol **should** provide the  
4277 following assurances:

4278 | 1. [The](#) identifiers for entities involved in the key-establishment protocol are correctly  
4279 associated with those entities. Assurance for the association of identifiers to entities  
4280 may be achieved by the key-agreement scheme or may be achieved by the protocol in  
4281 which key agreement is performed. Note that the identifier may be a “pseudo-  
4282 identifier”, not the identifier appearing on the entity’s birth certificate, for example.

4283 In the general case, an identifier is associated with each party involved in the key-  
4284 establishment protocol, and each entity in the key-establishment process must be able to  
4285 associate all the other entities with their appropriate identifier. In special cases, such as  
4286 the secure distribution of public information on a web site, the association with an  
4287 identifier may only be required for a subset of the entities (e.g., only the server).

4288 2. The keys used in the key-agreement scheme are correctly associated with the entities  
4289 involved in the key-establishment process.

4290 3. The derived keys are correct.

4291 Keys derived through key agreement and its enabling protocol **should not** be used to protect  
4292 and send information until the three assurances described above have been achieved.

### 4293 **8.1.5.3 Generation and Distribution of Other Keying Material**

4294 Keys are often generated in conjunction with or are used with other keying material. This other  
4295 keying material **shall** be protected in accordance with [Section 6.2](#).

#### 4296 **8.1.5.3.1 Domain Parameters**

4297 Domain parameters are used by some public-key algorithms to generate key pairs, to compute  
4298 digital signatures, or to establish keys. Typically, domain parameters are generated  
4299 infrequently and used by a community of users for a substantial period of time. Domain  
4300 parameters may be distributed in the same manner as the public keys with which they are  
4301 associated, or they may be made available at some other accessible site. Assurance of the  
4302 validity of the domain parameters **shall** be obtained prior to use, either by a trusted entity that  
4303 vouches for the parameters (e.g., a CA), or by the entities themselves. Assurance of domain-  
4304 parameter validity is addressed in [\[SP800-89\]](#) and [\[SP800-56A\]](#). Obtaining this assurance  
4305 **should** be addressed in a CA’s certification practices statement or an organization’s security  
4306 plan.

#### 4307 **8.1.5.3.2 Initialization Vectors**

4308 Initialization vectors (IVs) are used by symmetric-[key](#) algorithms in several modes of  
4309 operation for encryption and decryption, [for authentication, or both](#). The criteria for the

4321 generation and use of IVs are provided in [the \[SP800-38\] series of publications](#); IVs **shall** be  
4322 protected as specified in [Section 6 of this Recommendation \(i.e., SP 800-57, Part 1\)](#). When  
4323 distributed, IVs may be distributed in the same manner as their associated keys, or may be  
4324 distributed with the information that uses the IVs as part of the [cryptographic](#) mechanism.

- Deleted: [SP800-38A];
- Deleted: Section 6.
- Deleted: encryption or authentication

### 4325 8.1.5.3.3 Shared Secrets

4326 Shared secrets are computed during [an asymmetric](#) key-agreement [scheme](#) and are  
4327 subsequently used to derive keying material. Shared secrets are generated as specified by [an](#)  
4328 appropriate key-agreement scheme (see [\[SP800-56A\]](#) and [\[SP800-56B\]](#)), and **shall not** be used  
4329 [directly](#) as keying material.

- Deleted: process
- Deleted: the
- Deleted: [SP800-56A]
- Deleted: [SP800-56B]), but
- Deleted: RNG

### 4330 8.1.5.3.4 RBG Seeds

4331 [A Random Bit Generator \(RBG\) is a device or algorithm that outputs a sequence of bits that is](#)  
4332 [unpredictable; RBGs are often called Random Number Generators. Approved RBGs are](#)  
4333 [specified in \[SP800-90\]. RBGs depend on the introduction of truly random bits called seeds,](#)  
4334 [which are used to initialize an RBG and that must be kept secret. An initialized RBG is often](#)  
4335 [used to generate keys and other values requiring unpredictability. The seeds themselves shall](#)  
4336 [not be used for any purpose other than RBG input. Seeds shall only be transmitted using](#)  
4337 [secure channels that protect the confidentiality and integrity of the seeds, as well as providing](#)  
4338 [replay protection<sup>54</sup> and mutual authentication<sup>55</sup>.](#)

**Deleted:** Seeds are used to initialize a Deterministic Random Bit Generator (DRBG). The criteria for the selection of a seed for an RNG are provided in the specification of an approved DRBG (e.g., see [SP800-90A]). The seeds for an RNG consist of a string of bits containing entropy (i.e., entropy input) and may possibly include "other information" that may be either public or secret (see [SP800-90A]). The entropy input shall be destroyed immediately after use; however, all or a portion of the "other information" may be reused. Any portion of the "other information" that is public shall be protected as "other public information" (see Table 6); any portion of the "other information" that is secret shall be handled as "other secret information" (see Table 6). In this document, the term "RNG seed" will be used as a collective term for the entropy input and any other secret information that is used in the DRBG seeding process.¶ When entropy input or other secret information is distributed for seeding a DRBG, it shall be distributed using a secure channel that protects the integrity and confidentiality of the distributed material. When entropy input is distributed, the entity that distributes the entropy input shall destroy its copy of the entropy input immediately after distributing it.

### 4339 8.1.5.3.5 Other Public and Secret Information

4340 Public and secret information may be used during the seeding of an [RBG](#) (see [Section](#)  
4341 [8.1.5.3.4](#)) or during the generation or establishment of keying material (see [\[SP800-56A\]](#),  
4342 [\[SP800-56B\]](#) and [\[SP800-108\]](#)). Public information may be distributed; secret information  
4343 **shall** be protected in the same manner as a private or secret key during distribution.

- Deleted: RNG
- Deleted: Section 8.1.5.3.4)

- Deleted: [SP800-108]).
- Deleted: numbers
- Deleted: number is
- Deleted: to verify
- Deleted: [SP800-132]).

### 4344 8.1.5.3.6 Intermediate Results

4345 Intermediate results occur during computation using cryptographic algorithms. These results  
4346 **shall not** be distributed as or with the keying material.

### 4347 8.1.5.3.7 Random Bits/Numbers

4348 Random [bits \(or numbers\)](#) are used for many purposes, including the generation of keys and  
4349 nonces, and the issuing of challenges during communication protocols. Random [bits](#) may be  
4350 distributed, but whether or not confidentiality protection is required depends on the context in  
4351 which the random [bits are](#) used.

### 4352 8.1.5.3.8 Passwords

4353 Passwords are used [for identity](#) authentication or authorization, and, in some cases, to derive  
4354 keying material (see [\[SP800-132\]](#)). Passwords may be distributed, but their protection during  
4355 distribution **shall** be consistent with the protection required for their use. For example, if the  
4356 password will be used to access cryptographic keys that are used to provide 128 bits of security  
4357 strength when protecting data, then the password needs to be provided with at least 128 bits of  
4358 protection as well. Note that poorly selected passwords may not themselves provide the

<sup>54</sup> Assurance that a valid data transmission is not maliciously or fraudulently repeated or delayed.

<sup>55</sup> Authentication by each party in a transaction of the identity of the other party.

4403 required amount of protection for key access and are potentially the weak point of the process;  
4404 i.e., it may be far easier to guess the password than to attempt to “break” the cryptographic  
4405 protection used on the password. It is the responsibility of users and organizations to select  
4406 passwords that provide the requisite amount of protection for the keys they protect.

### 4407 8.1.6 Key Registration Function

4408 | Key registration results in the binding of keying material to information associated with a  
4409 particular entity. Keys that would be registered include the public key of an asymmetric key  
4410 pair and the symmetric key used to bootstrap an entity into a system. Normally, keys generated  
4411 during communications (e.g., using key-agreement schemes or key derivation functions) would  
4412 not be registered. Information provided during registration typically includes the identifier of  
4413 the entity associated with the keying material and the intended use of the keying material (e.g.,  
4414 as a signing key, data-encryption key, etc.). Additional information may include authorization  
4415 information or specify a level of trust. The binding is performed after the entity’s identity has  
4416 been authenticated by a means that is consistent with the system policy (see [Section 8.1.1](#)). The  
4417 binding provides assurance to the community-at-large that the keying material is used by the  
4418 correct entity in the correct application. The binding is often cryptographic, which creates a  
4419 strong association between the keying material and the entity. A trusted third party performs  
4420 the binding. Examples of a trusted third party include a Kerberos realm server or a PKI  
4421 certification authority (CA). Identifiers issued by a trusted third party **shall** be unique to that  
4422 party.

Deleted: or attributes

4423 When a Kerberos realm server performs the binding, a symmetric key is stored on the server  
4424 with the corresponding [metadata](#). In this case, the registered keying material is maintained in  
4425 [secure](#) storage (i.e., the keys are provided with confidentiality [and integrity](#) protection).

Deleted: the

Deleted: Section 8.1.1).

4426 When a CA performs the binding, the public key and associated [information \(often called](#)  
4427 [attributes\)](#) are placed in a public-key certificate, which is digitally signed by the CA. In this  
4428 case, the registered keying material may be [made](#) publicly available.

Deleted: attributes

Deleted: confidential

4429 When a CA provides a certificate for a public key, the public key **shall** be verified to ensure  
4430 that it is associated with the private key known by the purported owner of the public key. This  
4431 provides assurance of possession. When POP is used to obtain assurance of possession, the  
4432 assurance **shall** be accomplished as specified in [Section 8.1.5.1.1.2](#).

Deleted: Section 8.1.5.1.1.2.

### 4433 8.2 Operational Phase

4434 Keying material used during the cryptoperiod of a key is often stored for access as needed.  
4435 During storage, the keying material **shall** be protected as specified in [Section 6.2.2](#). During  
4436 normal use, the keying material is stored either on the device or module that uses that material,  
4437 or on an immediately accessible storage media. When the keying material is required for  
4438 operational use, the keying material is acquired from immediately accessible storage when not  
4439 present in active memory within the device or module.

Deleted: Section 6.2.2.

4440 To provide continuity of operations when the keying material becomes unavailable for use  
4441 from normal operational storage during its cryptoperiod (e.g., because the material is lost or  
4442 corrupted), keying material may need to be recoverable. If an analysis of system operations  
4443 indicates that the keying material needs to be recoverable, then the keying material **shall** either  
4444 be backed up (see [Section 8.2.2.1](#)), or the system **shall** be designed to allow reconstruction

Deleted: Section 8.2.2.1),

4453 (e.g., re-derivation) of the keying material. Retrieving or reconstructing keying material from  
4454 backup or an archive is commonly known as key recovery (see [Section 8.2.2.2](#)).

Deleted: Section 8.2.2.2).

4455 At the end of a key's cryptoperiod, a new key needs to be available to replace the old key if  
4456 operations are to be continued. This can be accomplished by re-keying (see [Section 8.2.3.1](#)) or  
4457 by key derivation (see [Section 8.2.4](#)). A key **shall** be destroyed in accordance with [Section](#)  
4458 [8.3.4](#), and **should** be destroyed as soon as that key is no longer needed in order to reduce the  
4459 risk of exposure.

Deleted: Section 8.2.3.1), key update (see Section 8.2.3.2),

Deleted: Section 8.2.4).

Deleted: Section 8.3.4

### 4460 8.2.1 Normal Operational Storage Function

4461 [One](#) objective of key management is to facilitate the operational availability of keying material  
4462 for standard cryptographic purposes. Usually, a key remains operational until the end of the  
4463 key's cryptoperiod (i.e., the expiration date). During normal operational use, keying material is  
4464 available either in the device or module (e.g., in RAM) or in an immediately accessible storage  
4465 media (e.g., on a local hard disk).

Deleted: The

#### 4466 8.2.1.1 Cryptographic Module Storage

4467 Keying material may be stored in the [cryptographic](#) module that adds, checks, or removes the  
4468 cryptographic protection on information. The storage of the keying material **shall** be consistent  
4469 with [Section 6.2.2](#), as well as with [\[FIPS140\]](#).

Deleted: Device or

Deleted: device or

Deleted: Section 6.2.2,

Deleted: [FIPS140].

#### 4470 8.2.1.2 Immediately Accessible Storage Media

4471 Keying material may need to be stored for normal cryptographic operations on an immediately  
4472 accessible storage media (e.g., a local hard drive) during the cryptoperiod of the key. The  
4473 storage requirements of [Section 6.2.2](#), **shall** apply to this keying material.

Deleted: Section 6.2.2

### 4474 8.2.2 Continuity of Operations Function

4475 Keying material can become lost or unusable, due to hardware damage, corruption or loss of  
4476 program or data files, system policy or configuration changes. In order to maintain the  
4477 continuity of operations, it is often necessary for users and/or administrators to be able to  
4478 recover keying materials from backup storage. However, if operations can be continued  
4479 without the backup of keying material (e.g., by re-keying), or the keying material can be  
4480 recovered or reconstructed without being saved, it may be preferable not to save the keying  
4481 material in order to lessen the possibility of a compromise of the keying material or other  
4482 cryptographically related information.

Deleted: or

4483 The compromise of keying material affects [the](#) continuity of operations (see [Section 8.4](#)).  
4484 When keying material is compromised, [the](#) continuity of operations requires the establishment  
4485 of entirely new keying material (see [Section 8.1.5](#)), following an assessment of what keying  
4486 material is affected and needs to be replaced.

Deleted: Section 8.4).

Deleted: Section 8.1.5),

#### 4487 8.2.2.1 Backup Storage

4488 The backup of keying material on an independent, secure storage media provides a source for  
4489 key recovery (see [Section 8.2.2.2](#)). Backup storage is used to store copies of information that  
4490 [are](#) also currently available in normal operational storage during a key's cryptoperiod (i.e., in  
4491 the cryptographic module, or on an immediately accessible storage media - see [Section](#)  
4492 [8.2.1.1](#)). Not all keys need be backed up. The storage requirements of [Section 6.2.2](#), apply to  
4493 keying material that is backed up. Tables [7](#) and [8](#) provide guidance about the backup of each

Deleted: Section 8.2.2.2).

Deleted: is

Deleted: device or

Deleted: Section 8.2.1.1).

Deleted: Section 6.2.2

Deleted: 7

Deleted: 8

4515 type of keying material and other related information. An “OK” indicates that storage is  
 4516 permissible, but not necessarily required. The final determination for backup **should** be made  
 4517 based on the application in which the keying material is used. A detailed discussion about [the](#)  
 4518 [backup of](#) each type of key and other cryptographic information is provided in [Appendix B.3](#).

Deleted: Appendix B.3.

4519 Keying material maintained in backup **should** remain in storage for at least as long as the same  
 4520 keying material is maintained in storage for normal operational use (see [Section 8.2.1](#)). When  
 4521 no longer needed for normal operational use, the keying material and other related information  
 4522 **should** be removed from backup storage. When removed from backup storage, all traces of the  
 4523 information in backup storage **shall** be destroyed in accordance with [Section 8.3.4](#).

Deleted: Section 8.2.1).

Deleted: Section 8.3.4.

4524 A discussion of backup and recovery is provided in [\[ITLBulletin\]](#).

Deleted: [ITLBulletin].

4525 **Table 7: Backup of keys**

Type of Key	Backup?
Private signature key	No (in general); <a href="#">support for</a> non-repudiation would be in question. However, <a href="#">backup</a> may be warranted in some cases – a CA’s private signing key, for example. When required, any backed up keys <b>shall</b> be stored under the owner’s control.
Public signature-verification key	OK; its presence in a public-key certificate that is available elsewhere may be sufficient.
Symmetric authentication key	OK
Private authentication key	OK, if required by an application.
Public authentication key	OK; if required by an application.
Symmetric data encryption key	OK

4534

4535 **8.2.2.2 Key Recovery Function**

4536 Keying material that is in active memory or stored in normal operational storage may  
 4537 sometimes be lost or corrupted (e.g., from a system crash or power fluctuation). Some of the  
 4538 keying material is needed to continue operations and cannot easily be replaced. An assessment  
 4539 needs to be made of which keying material needs to be preserved for possible recovery at a  
 4540 later time.

4541 The decision as to whether key recovery is required **should** be made on a case-by-case basis.  
 4542 The decision **should** be based on:

- 4543 1. The type of key (e.g., private signature key, or symmetric data-encryption key);
- 4544 2. The application in which the key will be used (e.g., interactive communications, or file  
 4545 storage);

Deleted: ,

Deleted: ),

Deleted: ,

Deleted: ),

- 4551 3. Whether the key is "owned" by the local entity (e.g., a private key) or by another entity
- 4552 (e.g., the other entity's public key) or is shared (e.g., a symmetric data-encryption key
- 4553 shared by two entities);
- 4554 4. The role of the entity in a communication (e.g., sender or receiver); and
- 4555 5. The algorithm or computation in which the key will be used (e.g., does the entity have
- 4556 the necessary information to perform a given computation if the key were to be
- 4557 recovered)<sup>56</sup>.

Deleted: ),

Deleted: ),

4558 The factors involved in a decision for or against key recovery **should** be carefully assessed.

4559 The trade-offs are concerned with continuity of operations versus the risk of possibly exposing

4560 the keying material and the information it protects if control of the keying material is lost. If it

4561 is determined that a key needs to be recovered, and the key is still active (i.e., the cryptoperiod

4562 of the key has not expired), then the key may be replaced in order to limit the exposure of the

4563 data protected by that key (see [Section 8.2.3](#)).

Deleted: a

Deleted: Section 8.2.3).

4564 Issues associated with key recovery and discussions about whether or not different types of

4565 cryptographic material need to be recoverable are provided in [Appendix B](#).

Deleted: Appendix B.

4566 **8.2.3 Key Change Function**

4567 Key change is the replacement of a key with another key that performs the same function as the

4568 original key. There are several reasons for changing a key.

- 4569 1. The key may have been compromised.
- 4570 2. The key's cryptoperiod may be nearing expiration.
- 4571 3. It may be desirable to limit the amount of data protected with any given key.

4572 **8.2.3.1 Re-keying**

4573 If the new key is generated in a manner that is entirely independent of the "value" of the old

4574 key, the process is known as re-keying. This replacement **shall** be accomplished using one of

4575 the key-establishment methods discussed in [Section 8.1.5](#). Re-keying is used when a key has

4576 been compromised (provided that the re-keying scheme itself is not compromised) or when the

4577 cryptoperiod is nearing expiration.

Deleted: A key may be replaced by re-keying or by key update.¶

Deleted: Section 8.1.5.

4578 **8.2.3.2 Key Update Function**

4579 If the "value" of the new key is dependent on the value of the old key, the process is known as

4580 key update (i.e., the current key is modified to create a new key). [Key update is a special case of key derivation \(see Section 8.2.4\), where the derived key replaces the key used to derive it. For example, suppose that  \$K\_1\$  is used as an encryption key. When  \$K\_1\$  needs to be replaced, it is used to derive  \$K\_2\$ .  \$K\_2\$  is then used as the new encryption key until it is replaced by  \$K\_3\$ , which is derived from  \$K\_2\$ .](#)

Deleted: This shall be accomplished by applying a non-reversible function to the old key and possibly other data. Unlike re-keying, key update may not require the exchange of any new information between the entities that previously shared the old key. For example, the two entities may agree to update their shared key on the first day of each month. Since a non-reversible function is used in the update process, previous keys are protected in the event that a key is compromised. However, future keys are not protected. After a limited number of updates, new keying material shall be established by employing a fresh re-key operation (see Section 8.2.3.1). Key update is often used to limit the amount of data protected by a single key, but it shall not be used to replace a compromised key.

4585 [Key update could result in a security exposure if an adversary obtains a key in the chain of keys and knows the update process used; keys subsequent to the compromised key could easily be determined.](#)

Deleted: SP 800-56A

Deleted: SP 800-56B).

<sup>56</sup> This could be the case when performing a key-establishment process for some key-establishment schemes (see [\[SP800-56A\]](#) and [\[SP800-56B\]](#)).

4612 [Federal applications shall not use key update \(also, see \[SP800-152\]\).](#)

4613 **8.2.4 Key Derivation Methods**

Deleted: Function

4614 Cryptographic keys may be derived from a secret value. The secret value, together with other  
4615 information, is input into a key-derivation method (e.g., a key-derivation function) that outputs  
4616 the required key(s). In contrast to key change, the derived keys are often used for new  
4617 purposes, rather than for replacing the secret values from which they are derived. The  
4618 derivation method **shall** be non-reversible (i.e., a one-way function) so that the secret value  
4619 cannot be determined from the derived keys. In addition, it **shall not** be possible to determine a  
4620 derived key from other derived keys. It should be noted that the strength of a derived key is no  
4621 greater than the strength of the derivation algorithm and the secret value from which the key is  
4622 derived.

4623 Three commonly used key-derivation cases are discussed below.

4624 1. *Two parties derive common keys from a common shared secret.* This approach is used  
4625 in the key-establishment techniques specified in [\[SP800-56A\]](#) and [\[SP800-56B\]](#). The  
4626 security of this process is dependent on the security of the shared secret and the specific  
4627 key-derivation method used. If the shared secret is known, the derived keys may be  
4628 determined. A key-derivation method specified [or allowed](#) in [SP800-56A], [SP800-  
4629 56B] or [\[SP800-56C\]](#), **shall** be used for this purpose. These derived keys may be used to  
4630 provide the same confidentiality, [identity](#) authentication, and [source authentication](#)  
4631 services as randomly generated keys, with a security strength determined by the scheme  
4632 and key pairs used to generate the shared secret.

Deleted: [SP800-56A]

Deleted: [SP800-56B].

Deleted: [SP800-56C]

Deleted: data integrity

4633 2. *Keys derived from a key-derivation key (master key).* This is often accomplished by  
4634 using the key-derivation key, entity ID, and other known information as input to a  
4635 function that generates the keys. One of the key-derivation functions defined in [\[SP800-  
4636 108\]](#), **shall** be used for this purpose. The security of this process depends upon the  
4637 security of the key-derivation key and the key-derivation function. If the key-derivation  
4638 key is known by an adversary, he can generate any of the derived keys. Therefore, keys  
4639 derived from a key-derivation key are only as secure as the key-derivation key itself. As  
4640 long as the key-derivation key is kept secret, the derived keys may be used in the same  
4641 manner as randomly generated keys.

Deleted: [SP800-108]

4642 3. *Keys derived from a password.* A user-generated password, by its very nature, is less  
4643 random (i.e., has lower entropy) than is required for a cryptographic key; that is, the  
4644 number of passwords that are likely to be used to derive a key is significantly smaller  
4645 than the number of keys that are possible for a given key size. In order to increase the  
4646 difficulty of exhaustively searching the likely passwords, a key-derivation function is  
4647 iterated a large number of times. The key is derived using a password, entity ID, and  
4648 other known information as input to the key-derivation function. The security of the  
4649 derived key depends upon the security of the password and the key-derivation process.  
4650 If the password is known or can be guessed, then the corresponding derived key can be  
4651 generated. Therefore, keys derived in this manner are likely to be less secure than  
4652 randomly generated keys, or keys derived from a shared secret or key-derivation key.  
4653 For storage applications, one of the key-derivation methods specified in [\[SP800-132\]](#),  
4654 **shall** be used to derive keys. For non-storage applications, keys derived in this manner

Deleted: .

Deleted: [SP800-132]

4663 | shall be used for integrity, and source authentication purposes only and not for general  
 4664 encryption.

4665 **8.3 Post-Operational Phase**

4666 During the post-operational phase, keying material is no longer in operational use, but access  
 4667 to the keying material may still be possible.

4668 **8.3.1 Archive Storage and Key Recovery Functions**

4669 A key archive is a repository containing keying material and other related information for  
 4670 recovery beyond the cryptoperiod of the keys. Not all keying material needs to be archived. An  
 4671 organization's security plan should indicate the types of information that are to be archived  
 4672 (see [SP800-57, Part 2]).

4673 The archive shall continue to provide the appropriate protections for each key and any other  
 4674 related information in the archive, as specified in Section 6.2.2. The archive will require a  
 4675 strong access-control mechanism to limit access to only authorized entities. When keying  
 4676 material is entered into the archive, it is often time-stamped so that the date-of-entry can be  
 4677 determined. This date may itself be cryptographically protected so that it cannot be changed  
 4678 without detection.

4679 If keying material needs to be recoverable (e.g., after the end of its cryptoperiod), either the  
 4680 keying material **shall** be archived, or the system **shall** be designed to allow reconstruction (e.g.,  
 4681 re-derivation) of the keying material from archived information. Retrieving the keying material  
 4682 from archive storage or by reconstruction is commonly known as key recovery. The archive  
 4683 **shall** be maintained by a trusted party (e.g., the organization associated with the keying  
 4684 material or a trusted third party).

4685 While in storage, archived information may be either static (i.e., never changing) or may need  
 4686 to be re-encrypted under a new archive-encryption key from time-to-time. Archived data  
 4687 should be stored separately from operational data, and multiple copies of archived  
 4688 cryptographic information should be provided in physically separate locations (i.e., it is  
 4689 recommended that the key archive be backed up). For critical information that is encrypted  
 4690 under archived keys, it may be necessary to back up the archived keys and to store multiple  
 4691 copies of these archived keys in separate locations.

4692 When archived, keying material **should** be archived prior to the end of the cryptoperiod of the  
 4693 key. For example, it may be prudent to archive the keying material during key activation.  
 4694 When no longer required, the keying material **shall** be destroyed in accordance with Section  
 4695 8.3.4.

4696 The confidentiality of archived information is provided by an archive-encryption key (one or  
 4697 more encryption keys that are used exclusively for the encryption of archived information), by  
 4698 another key that has been archived, or by a key that may be derived from an archived key.  
 4699 Note that the algorithm with which the archive-encryption key is used may also provide  
 4700 integrity protection for the encrypted information. When encrypted by the archive-encryption  
 4701 key, the encrypted keying material **shall** be re-encrypted by any new archive-encryption key at  
 4702 the end of the cryptoperiod of the old archive-encryption key. When the keying material is re-  
 4703 encrypted, integrity values on that keying material **shall** be recomputed. This may impose a

**Deleted:** An

**Deleted:** for

**Moved (insertion) [9]**

**Deleted:** both integrity and access control. Integrity is required in order to protect the archived material from unauthorized modification, deletion,

**Deleted:** insertion. Access control is needed to prevent unauthorized disclosure. Archived information **shall** be protected

**Deleted:** Section 6.2.2.

**Deleted:** timestamped

**Deleted:** A key management archive is a repository containing keying material and other related information for recovery as needed.

**Moved up [9]:** Not all keying material needs to be archived. An organization's security plan **should** indicate the types of information that are to be archived (see

**Deleted:** Part 2). ¶

**Deleted:** management

**Deleted:** archive

**Deleted:** archive

**Deleted:** Section 8.3.4.

**Deleted:** Archived cryptographic information requires protection in accordance with Section 6.2.2. Confidentiality

**Deleted:** imposes

4730 significant burden; therefore, the strength of the cryptographic algorithm and archive-  
 4731 encryption key shall be selected to minimize the need for re-encryption.

4732 When the archive-encryption key and its associated algorithm do not also provide integrity  
 4733 protection for the encrypted information, integrity protection shall be provided by a separate  
 4734 archive-integrity key (i.e., one or more authentication or digital-signature keys that are used  
 4735 exclusively for the archive) or by another key that has been archived. If integrity protection is  
 4736 to be maintained at the end of the cryptoperiod of the archive-integrity key, new integrity  
 4737 values **shall** be computed on the archived information on which the old archive-integrity key  
 4738 was applied.

4739 When the confidentiality and integrity protection of the archived information is provided using  
 4740 separate processes, the archive-encryption key and archive-integrity key (when used) shall be  
 4741 different from each other (e.g., independently generated), and shall be protected in the same  
 4742 manner as their key type (see Section 6). Note that these two services can also be provided  
 4743 using authenticated encryption, which uses a single cryptographic algorithm operation and a  
 4744 single key.

4745 Tables 9 and 10 indicate the appropriateness of archiving keys and other cryptographically  
 4746 related information. An “OK” in column 2 (Archive?) indicates that archival is permissible,  
 4747 but not necessarily required. Column 3 (Retention period) indicates the minimum time that the  
 4748 key **should** be retained in the archive. Additional advice on the storage of keying material in  
 4749 archive storage is provided in Appendix B.3.

4750 **Table 9: Archive of keys**

Type of Key	Archive?	Retention period (minimum)
Private signature key	No	
Public signature-verification key	OK	Until no longer required to verify data signed with the associated private key
Symmetric authentication key	OK	Until no longer needed to authenticate data or an identity.
Private authentication key	No	
Public authentication key	OK

Public key-transport key	OK	
Symmetric key-agreement key	OK	
Private static key-agreement key	OK	
Public static key-agreement key	OK	Until no longer needed to reconstruct keying material.
Private ephemeral key-agreement key	No	
Public ephemeral key-agreement key	OK	
Symmetric authorization key	No	
Private authorization key	No	
Public authorization key	OK	

4766

4767 **Table 10: Archive of other cryptographic related information**

Type of Key	Archive?	Retention period (minimum)
Domain parameters	OK	Until all keying material, signatures and signed data using the domain parameters are removed from the archive
Initialization vector	OK; normally stored with the protected information	Until no longer needed to process the protected data
Shared secret	No	
<a href="#">RBC</a> seed	No	
Other public information	OK	Until no longer needed to process data using the public information
Other secret information	OK	Until no longer needed to process data using the secret information

Deleted: RNG

Intermediate result	No	
Key control information (e.g., IDs, purpose)	OK	Until the associated key is removed from the archive
Random number		Depends on <a href="#">the</a> application or use of the random number
Password	OK when used to derive keys or to detect the reuse of passwords; otherwise, No	Until no longer needed to (re-)derive keys or to detect password reuse
Audit information	OK	Until no longer needed

4769

4770 The recovery of archived keying material may be required to remove (e.g., decrypt) or check  
 4771 (e.g., verify a digital signature or a MAC) the cryptographic protections on other archived data;  
 4772 [recovered keys shall not be used to apply cryptographic protection](#). The key recovery process  
 4773 results in retrieving or reconstructing the desired keying material from archive storage in order  
 4774 to perform the required cryptographic operation. Immediately after completing this operation,  
 4775 the keying material **shall** be erased from the cryptographic process<sup>57</sup> [for which it was](#)  
 4776 [recovered \(i.e., it shall not be used for normal operational activities\)](#). However, the key **shall**  
 4777 be retained in the archive (see [Section 8.3.4](#)) as long as needed. Further advice on key recovery  
 4778 issues is provided in [Appendix B](#).

Deleted: .

Deleted: , but

Deleted: Section 8.3.4)

Deleted: Appendix B.

4779 **8.3.2 Entity De-registration Function**

4780 The entity de-registration function removes the authorizations of an entity to participate in a  
 4781 security domain. When an entity ceases to be a member of a security domain, the entity **shall**  
 4782 be de-registered. De-registration is intended to prevent other entities from relying on or using  
 4783 the de-registered entity's keying material.

4784 All records of the entity and the entity's associations **shall** be marked to indicate that the entity  
 4785 is no longer a member of the security domain, but the records **should not** be deleted. To reduce  
 4786 confusion and unavoidable human errors, identification information associated with the de-  
 4787 registered entity **should not** be re-used (at least for a period of time). For example, if a "John  
 4788 Wilson" retires and is de-registered on Friday, the identification information assigned to his  
 4789 son "John Wilson", who is hired the following Monday, **should** be different.

4790 **8.3.3 Key De-registration Function**

4791 Registered keying material may be associated with the identity of a key owner, owner  
 4792 [information](#) (e.g., email address), role or authorization information. When the keying material  
 4793 is no longer needed, or the associated information becomes invalid, the keying material **should**  
 4794 be de-registered (i.e., all records of the keying material and its associations **should** be marked

Deleted: attributes

<sup>57</sup> [For example, an archived symmetric key could be recovered to decrypt a single message or file, or could be used to decrypt multiple messages or files, all of which were encrypted using that key during its originator-usage period.](#)

4800 to indicate that the key is no longer in use) by the appropriate trusted third party. In general,  
4801 this will be the trusted third party that registered the key (see [Section 8.1.6](#)).

Deleted: Section 8.1.6).

4802 Keying material **should** be de-registered when the [information](#) associated with an entity [is](#)  
4803 modified. For example, if an entity's email address is associated with a public key, and the  
4804 entity's address changes, the keying material **should** be de-registered to indicate that the  
4805 associated [information has](#) become invalid. Unlike the case of [a key compromise](#), the entity  
4806 could safely re-register the public key after modifying the entity's [information](#) through the user  
4807 registration process (see [Section 8.1.1](#)).

Deleted: attributes

Deleted: are

Deleted: attributes have

Deleted: attributes

Deleted: Section 8.1.1).

4808 When a registered cryptographic key is compromised, that key and any associated keying  
4809 material **shall** be de-registered. When the compromised key is the private part of a public-  
4810 private key pair, the public key **shall** also be revoked (see [Section 8.3.5](#)). If the [registration](#)  
4811 [information](#) associated with a public-private key pair [is](#) changed, but the private key has not  
4812 been compromised, the public key **should** be revoked with an appropriate reason code (see  
4813 [Section 8.3.5](#)).

Deleted: Section 8.3.5).

Deleted: attributes

Deleted: are

Deleted: Section 8.3.5).

### 4814 8.3.4 Key Destruction Function

4815 When copies of cryptographic keys are made, care should be taken to provide for their eventual  
4816 destruction. All copies of the private or symmetric key **shall** be destroyed as soon as they are  
4817 no longer required (e.g., for archival or reconstruction activity) in order to minimize the risk of  
4818 a compromise. [Keys shall](#) be destroyed in a manner that removes all traces of the keying  
4819 material so that it cannot be recovered by either physical or electronic means<sup>58</sup>. Public keys  
4820 may be retained or destroyed, as desired.

Deleted: Any media on which unencrypted keying material requiring confidentiality protection is stored

### 4821 8.3.5 Key Revocation Function

4822 It is sometimes necessary to remove keying material from use prior to the end of its normal  
4823 cryptoperiod for reasons that include key compromise, removal of an entity from an  
4824 organization, etc. This process is known as key revocation and is used to explicitly revoke a  
4825 symmetric key or the public key of a key pair, although the private key [corresponding to](#) the  
4826 public key is also revoked.

Deleted: associated with

4827 Key revocation may be accomplished using a notification indicating that the continued use of  
4828 the keying material is no longer recommended. The notification could be provided by actively  
4829 sending the notification to all entities that might be using the revoked keying material, or by  
4830 allowing the entities to request the status of the keying material (i.e., a "push" or a "pull" of the  
4831 status information). The notification **should** include a complete identification of the keying  
4832 material ([excluding the key itself](#)), the date and time of revocation and the reason for  
4833 revocation, when appropriate (e.g., [a key compromise](#)). Based on the revocation information  
4834 provided, other entities could then make a determination of how they [will](#) treat information  
4835 protected by the revoked keying material.

Deleted: .

Deleted: compromised

Deleted: would

4836 For example, if a public signature-verification key is revoked because an entity left an  
4837 organization, it may be appropriate to honor all signatures created prior to the revocation date,

Deleted: .

<sup>58</sup> A simple deletion of the keying material might not completely obliterate the information. For example, erasing the information might require overwriting that information multiple times with other non-related information, such as random bits, or all zero or one bits. Keys stored in memory for a long time can become "burned in". This can be mitigated by splitting the key into components that are frequently updated (see [\[DiCrescenzo\]](#)).

Deleted: [DiCrescenzo]).

4855 | (i.e., to continue to verify those signatures and accept them as valid if the verification is  
4856 | successful). If a signing private key is compromised, resulting in the revocation of the  
4857 | corresponding public key, an assessment needs to be made as to whether or not information  
4858 | signed prior to the revocation notice would be considered as valid.

Deleted: associated

4859 | As another example, a symmetric key that is used to generate MACs may be revoked so that it  
4860 | will not be used to generate MACs on new information. However, the key may be retained so  
4861 | that archived documents can be verified.

4862 | The details for key revocation **should** reflect the lifecycle for each particular key. If a key is  
4863 | used in a pair-wise situation (e.g., two entities communicating using the same encryption key),  
4864 | the entity revoking the key **shall** inform the other entity of the revocation. If the key has been  
4865 | registered with an infrastructure, the entity revoking the key cannot always directly inform the  
4866 | other entities that may rely upon that key. Instead, the entity revoking the key **shall** inform the  
4867 | infrastructure that the key needs to be revoked (e.g., using a certificate revocation request). The  
4868 | infrastructure **shall** respond by de-registering the key material (see Section 8.3.3).

Deleted: in a secure session

Deleted: 8.3.3).

4869 | In a PKI, key revocation is commonly achieved by including the certificate in a list of revoked  
4870 | certificates (i.e., a CRL). If the PKI uses online status mechanisms (e.g., the Online Certificate  
4871 | Status Protocol [RFC 2560]), revocation is achieved by informing the appropriate certificate  
4872 | status server(s). For example, when a private key is compromised, the corresponding public-  
4873 | key certificate **shall** be revoked as soon as possible. Certificate revocation because of a key  
4874 | compromise indicates that the binding between the owner and the key is no longer to be  
4875 | trusted; relying parties **should not accept the certificate without seriously considering the risks  
4876 | and consulting the organization's policy about this situation.** Other revocation reasons indicate  
4877 | that, even though the original binding may still be valid and the key was not compromised, the  
4878 | use of the public key in the certificate **should** be terminated; again, the relying party **should  
4879 | consult his organization's policy on this issue.**

Deleted: [RFC 2560]),

Deleted: should

Deleted: .

Deleted: is invalid, but

Deleted: private

4880 | In a symmetric-key system, key revocation could, in theory, be achieved by simply deleting the  
4881 | key from the server's storage. Key revocation for symmetric keys is more commonly achieved  
4882 | by adding the key to a blacklist or compromised key list; this helps satisfy auditing and  
4883 | management requirements.

#### 4884 | 8.4 Destroyed Phase

4885 | The keying material is no longer available. All records of its existence may have been deleted,  
4886 | though this is not required. Some organizations may require the retention of certain key  
4887 | metadata elements for audit purposes. For example, if a copy of an ostensibly destroyed key is  
4888 | found in an uncontrolled environment or is later determined to have been compromised,  
4889 | records of the identifier of the key, its type, and its cryptoperiod may be helpful in determining  
4890 | what information was protected under the key and how best to recover from the compromise.

Deleted: . However,

Deleted: attributes

4891 | In addition, by keeping a record of the metadata of both destroyed and compromised keys, one  
4892 | will be able to track which keys transitioned through a normal lifecycle and which ones were  
4893 | compromised at some time during their lifecycle. Thus, protected information that is linked to  
4894 | key names that went through the normal lifecycle may still be considered secure, provided that  
4895 | the security strength of the algorithm remains sufficient. However, any protected information  
4896 | that is linked to a key name that has been compromised may itself be compromised.

Deleted: attributes

Deleted: destroyed

## 4909 9 Accountability, Audit, and Survivability

4910 Systems that process valuable information require controls in order to protect the information  
4911 from unauthorized disclosure and modification. Cryptographic systems that contain keys and  
4912 other cryptographic information are especially critical. Three useful control principles and their  
4913 application to the protection of keying material are highlighted in this section.

### 4914 9.1 Accountability

4915 Accountability involves the identification of those entities that have access to, or control of,  
4916 cryptographic keys throughout their lifecycles. Accountability can be an effective tool to help  
4917 prevent key compromises and to reduce the impact of compromises when they are detected.  
4918 Although it is preferred that no humans be able to view keys, as a minimum, the key  
4919 management system **should** account for all individuals who are able to view plaintext  
4920 cryptographic keys. In addition, more sophisticated key-management systems may account for  
4921 all individuals authorized to access or control any cryptographic keys, whether in plaintext or  
4922 ciphertext form. For example, a sophisticated accountability system might be able to determine  
4923 each individual who had control of any given key over its entire lifespan. This would include  
4924 the person in charge of generating the key, the person who used the key to cryptographically  
4925 protect data, anyone else known to have accessed the key, and the person who was responsible  
4926 for destroying the key when it was no longer needed. Even though these individuals may never  
4927 have actually seen the key in plaintext form, they are held accountable for the actions that they  
4928 performed on or with the key.

Deleted: once

Deleted: are

4929 Accountability provides three significant advantages:

- 4930 1. It aids in the determination of when the compromise could have occurred and what  
4931 individuals could have been involved,
- 4932 2. It tends to protect against compromise, because individuals with access to the key know  
4933 that their access to the key is known, and
- 4934 3. It is very useful in recovering from a detected key compromise to know where the key  
4935 was used and what data or other keys were protected by the compromised key.

Deleted: saw

4936 Certain principles have been found to be useful in enforcing the accountability of  
4937 cryptographic keys. These principles might not be applicable to all systems or all types of keys.  
4938 Some of the principles apply to long-term keys that are controlled by humans. The principles  
4939 include:

Deleted: apply

- 4940 a. Uniquely identifying keys;
- 4941 b. Identifying the key user;
- 4942 c. Identifying the dates and times of key use, along with the data that is protected, and
- 4943 d. Identifying other keys that are protected by a symmetric or private key.

Deleted: ,

Deleted: ,

### 4944 9.2 Audit

4945 Two types of audit **should** be performed on key-management systems:

- 4952 1. The security plan and the procedures that are developed to support the plan **should** be  
 4953 periodically audited to ensure that they continue to support the Key Management Policy  
 4954 (see [\[SP800-57, Part 2\]](#)).
- 4955 2. The protective mechanisms employed **should** be periodically reassessed with respect to  
 4956 the level of security that they provide and are expected to provide in the future, and that  
 4957 the mechanisms correctly and effectively support the appropriate policies. New  
 4958 technology developments and attacks **should** be taken into consideration.

Deleted: Part 2).

4959 On a more frequent basis, the actions of the humans that use, operate and maintain the system  
 4960 **should** be reviewed to verify that the humans continue to follow established security  
 4961 procedures. Strong cryptographic systems can be compromised by lax and inappropriate  
 4962 human actions. Highly unusual events **should** be noted and reviewed as possible indicators of  
 4963 attempted attacks on the system.

### 4964 9.3 Key Management System Survivability

#### 4965 9.3.1 Backup Keys

4966 [\[OMB11/01\]](#) notes that encryption is an important tool for protecting the confidentiality of  
 4967 disclosure-sensitive information that is entrusted to an agency’s care, but that the encryption of  
 4968 agency data also presents risks to the availability of information needed for mission  
 4969 performance. Agencies are reminded of the need to protect the continuity of their information  
 4970 technology operations and agency services when implementing encryption. The guidance  
 4971 specifically notes that, without access to the cryptographic keys that are needed to decrypt  
 4972 information, organizations risk the loss of their access to that information. Consequently, it is  
 4973 prudent to retain [backed up or archived](#) copies of the keys necessary to decrypt stored  
 4974 enciphered information, including master keys, key-[wrapping](#) keys, and the related keying  
 4975 material necessary to decrypt encrypted information until there is no longer any requirement  
 4976 for access to the underlying plaintext information (see Tables [7](#) and [8](#) in [Section 8.2.2.1](#)).

Deleted: [OMB11/01]

4977 As the tables in [Section 8.2.2.1](#) show, there are other operational keys in addition to those  
 4978 associated with decryption that organizations may need to backup (e.g. public signature-  
 4979 verification keys and authorization keys). [Backed up or archived](#) copies of keying material  
 4980 **shall** be stored in accordance with the provisions of [Section 6](#) in order to protect the  
 4981 confidentiality of encrypted information and the integrity of source authentication, [integrity](#)  
 4982 [authentication](#), and authorization processes.

Deleted: backup

Deleted: encrypting

Deleted: 7

Deleted: 8

Deleted: Section 8.2.2.1).

Deleted: Backup

Deleted: Section 6

Deleted: data

#### 4983 9.3.2 Key Recovery

4984 There are a number of issues associated with key recovery. An extensive discussion is provided  
 4985 in [Appendix B](#). Key recovery issues to be addressed include:

Deleted: Appendix B.

- 4986 1. Which keying material, if any, needs to be backed up or archived for later recovery?  
 4987 2. Where will backed-up or archived keying material be stored?  
 4988 3. When will archiving be done (e.g., during key activation or at the end of a key’s  
 4989 cryptoperiod)?  
 4990 4. Who will be responsible for protecting the backed-up or archived keying material?  
 4991 5. What procedures need to be put in place for storing and recovering the keying material?

- 5003 6. Who can request a recovery of the keying material and under what conditions?
- 5004 7. Who will be notified when a key recovery has taken place and under what conditions?
- 5005 8. What audit or accounting functions need to be performed to ensure that the keying
- 5006 material is only provided to authorized entities?

5007 **9.3.3 System Redundancy/Contingency Planning**

5008 Cryptography is a useful tool for preventing unauthorized access to data and/or resources, but  
5009 when the mechanism fails, it can prevent access by valid users to critical information and  
5010 processes. Loss or corruption of the only copy of cryptographic keys can deny users access to  
5011 information. For example, a locksmith can usually defeat a broken physical mechanism, but  
5012 access to information encrypted by a strong algorithm may not be practical without the correct  
5013 decryption key. The continuity of an organization’s operations can depend heavily on  
5014 contingency planning for key-management systems that includes a redundancy of critical  
5015 logical processes and elements, including key management and cryptographic keys.

5016 **9.3.3.1 General Principles**

5017 Planning for recovery from system failures is an essential management function. Interruptions  
5018 of critical infrastructure services **should** be anticipated, and planning for maintaining the  
5019 continuity of operations in support of an organization’s primary mission requirements **should**  
5020 be done. With respect to key management, the following situations are typical of those for  
5021 which planning is necessary:

- 5022 1. Lost key cards or tokens;
- 5023 2. Forgotten passwords that control access to keys;
- 5024 3. Failure of key input devices (e.g., readers);
- 5025 4. Loss or corruption of the memory media on which keys and/or certificates are stored;
- 5026 5. Compromise of keys;
- 5027 6. Corruption of Certificate Revocation Lists (CRLs) or Compromised Key Lists (CKLs);
- 5028 7. Hardware failure of key or certificate generation, registration, and/or distribution
- 5029 systems, subsystems, or components;
- 5030 8. Power loss requiring re-initialization of key or certificate generation, registration,
- 5031 and/or distribution systems, subsystems, or components;
- 5032 9. Corruption of the memory media necessary for key or certificate generation,
- 5033 registration, and/or distribution systems, subsystems, or components;
- 5034 10. Corruption or loss of key or certificate distribution records and/or audit logs;
- 5035 11. Loss or corruption of the association of keying material to the owners/users of the
- 5036 keying material; and
- 5037 12. Unavailability of older software or hardware that is needed to access keying material or
- 5038 process protected information.

5039 While recovery discussions most commonly focus on the recovery of encrypted data and the  
5040 restoration of encrypted communication capabilities, planning **should** also address 1) the

Deleted: ,

Deleted: ,

Deleted: ,

Deleted: ,

Deleted: ,

Deleted: ,

Deleted: ,

Deleted: ,

Deleted: holders

Deleted: ,

Deleted: communications

5054 | restoration of access (without creating a temporary loss of access protections) where  
5055 | cryptography is used in access control mechanisms, 2) the restoration of critical processes  
5056 | (without creating a temporary loss of privilege restrictions) where cryptography is used in  
5057 | authorization mechanisms, and 3) the maintenance/restoration of integrity protection in digital  
5058 | signature and message authentication applications.

5059 | Contingency planning **should** include 1) providing a means and assigning responsibilities for  
5060 | rapidly recognizing and reporting critical failures; 2) the assignment of responsibilities and the  
5061 | placement of resources for bypassing or replacing failed systems, subsystems, and components;  
5062 | and 3) the establishment of detailed bypass and/or recovery procedures.

5063 | Contingency planning includes a full range of integrated logistics support functions. Spare  
5064 | parts (including copies of critical software programs, manuals, and data files) **should** be  
5065 | available (acquired or arranged for) and pre-positioned (or delivery-staged). Emergency  
5066 | maintenance, replacement, and/or bypass instructions **should** be prepared and disseminated to  
5067 | both designated individuals and to an accessible and advertised access point. Designated  
5068 | individuals **should** be trained in their assigned recovery procedures, and all personnel **should**  
5069 | be trained in reporting procedures and workstation-specific recovery procedures.

#### 5070 | **9.3.3.2 Cryptography and Key Management-specific Recovery Issues**

5071 | Cryptographic keys are relatively small components or data elements that often control access  
5072 | to large volumes of information or critical processes. As the Office of Management and Budget  
5073 | has noted in [OMB11/01], “without access to the cryptographic key(s) needed to decrypt  
5074 | information, [an] agency risks losing access to its valuable information.” Agencies are  
5075 | reminded of the need to protect the continuity of their information technology operations and  
5076 | agency services when implementing encryption. The guidance particularly stresses that  
5077 | agencies must address information availability and assurance requirements through appropriate  
5078 | data recovery mechanisms, such as cryptographic key recovery.

Deleted: [OMB11/01].

5079 | Key recovery generally involves some redundancy, or multiple copies of keying material. If  
5080 | one copy of a critical key is lost or corrupted, another copy usually needs to be available in  
5081 | order to recover data and/or restore capabilities. At the same time, the more copies of a key that  
5082 | exist and are distributed to different locations, the more susceptible the key usually is to  
5083 | compromise through penetration of the storage location or subversion of the custodian (e.g.,  
5084 | user, service agent, key production/distribution facility). In this sense, key confidentiality  
5085 | requirements conflict with continuity of operations requirements. Special care needs to be  
5086 | taken to safeguard all copies of keying material, especially symmetric keys and private  
5087 | (asymmetric) keys. More detail regarding contingency plans and planning requirements is  
5088 | provided in Part 2 of this *Recommendation for Key Management* [SP800-57, Part 2].

Deleted: .

#### 5089 | **9.3.4 Compromise Recovery**

5090 | When keying material that is used to protect sensitive information or critical processes is  
5091 | disclosed to unauthorized entities, all of the information and/or processes protected by that  
5092 | keying material becomes immediately subject to disclosure, modification, subversion, and/or  
5093 | denial of service. All compromised keys **shall** be revoked; all affected keys **shall** be replaced;  
5094 | and, where sensitive or critical information or processes are affected, an immediate damage  
5095 | assessment **should** be conducted. Measures necessary to mitigate the consequences of

5098 suspected unauthorized access to protected data or processes and to reduce the probability or  
5099 frequency of future compromises [should be undertaken](#).

**Deleted:** may follow.

5100 Where symmetric keys or private (asymmetric) keys are used to protect only a single user's  
5101 local information or communications between a single pair of users, the compromise recovery  
5102 process can be relatively simple and inexpensive. Damage assessment and mitigation measures  
5103 are often local matters.

5104 On the other hand, where a key is shared by or affects a large number of users, damage can be  
5105 widespread, and recovery is both complex and expensive. Some examples of keys, the  
5106 compromise of which might be particularly difficult or expensive to recover from, include the  
5107 following:

- 5108 1. A CA's private signature key, especially if it is used to sign a root certificate in a  
5109 public-key infrastructure;
- 5110 2. [A symmetric key-wrapping](#) key shared by a large number of users;
- 5111 3. [A private asymmetric key-transport](#) key shared by a large number of users;
- 5112 4. [A master key used in the derivation](#) of keys by a large number of users;
- 5113 5. [A symmetric data-encryption key used to encrypt data in a large distributed database](#);
- 5114 6. [A symmetric key shared by a large number of communications network participants](#);  
5115 [and](#)
- 5116 7. [A key used to protect a large number of stored keys](#).

**Deleted:** transport

**Deleted:** generation

5117 In all of these cases, a large number of key owners or relying parties (e.g., all parties authorized  
5118 to use the secret key of a symmetric-key algorithm or the public key of an asymmetric-key  
5119 algorithm) would need to be immediately notified of the compromise. The inclusion of the key  
5120 identifier on a Compromised Key List (CKL) or the certificate serial number on a Certificate  
5121 Revocation List (CRL) to be published at a later date might not be sufficient. This means that a  
5122 list of (the most-likely) affected entities might need to be maintained, and a means for  
5123 communicating news of the compromise would be required. Particularly in the case of the  
5124 compromise of a symmetric key, news of the compromise and the replacement of keys **should**  
5125 be sent only to the affected entities so as not to encourage others to exploit the situation.

5126 In all of these cases, a secure path for replacing the compromised keys is required. In order to  
5127 permit rapid restoration of service, an automated (e.g., over-the-air [or network-based](#))  
5128 replacement path is preferred (see [Section 8.2.3](#)). In some cases, however, there may be no  
5129 practical alternative to manual distribution (e.g., [the compromise of a root CA's private key](#)). [A](#)  
5130 contingency distribution of alternate keys may help restore service rapidly in some  
5131 circumstances (e.g., [the compromise of a widely held symmetric key](#)), but the possibility of [a](#)  
5132 simultaneous compromise of operational and contingency keys would need to be considered.

**Deleted:** Section 8.2.3).

5133 Damage assessment can be extraordinarily complex, particularly in cases such as the  
5134 compromise and replacement of CA private keys, widely used transport keys, and keys used by  
5135 many users of large distributed databases.

5140 **10 Key Management Specifications for Cryptographic**  
5141 **Devices or Applications**

5142 Key management is often an afterthought in the cryptographic development process. As a  
5143 result, cryptographic subsystems often fail to support the key management functionality and  
5144 protocols that are necessary to provide adequate security with the minimum necessary  
5145 reduction in operational efficiency. All cryptographic development activities **should** involve  
5146 key management planning and specification (see [\[SP800-57, Part 2\]](#)) by those managers  
5147 responsible for the secure implementation of cryptography into an information system. Key  
5148 management planning **should** begin during the initial conceptual/development stages of the  
5149 cryptographic development lifecycle, or during the initial discussion stages for the application  
5150 of existing cryptographic components into information systems and networks. The  
5151 specifications that result from the planning activities **shall** be consistent with NIST key  
5152 management guidance (see [\[SP800-130\]](#) and [\[SP800152\]](#)).

Deleted: Part 2)

Deleted: .

5153 For cryptographic development efforts, a key specification and acquisition planning process  
5154 **should** begin as soon as the candidate algorithm(s) and, if appropriate, keying material media  
5155 and format have been identified. Key management considerations may affect algorithm choice,  
5156 due to operational efficiency considerations for anticipated applications. For the application of  
5157 existing cryptographic [mechanisms](#) for which no key-management specification exists, the  
5158 planning and specification processes **should** begin during device and source selection, and  
5159 continue through acquisition and installation.

Deleted: products

5160 The types of key-management components that are required for a specific cryptographic device  
5161 and/or for suites of devices used by organizations **should** be standardized to the maximum  
5162 possible extent, and new cryptographic device-development efforts **shall** comply with NIST  
5163 key-management recommendations. Accordingly, NIST criteria for the security, accuracy, and  
5164 utility of key-management components in electronic and physical forms **shall** be met. Where  
5165 the criteria for security, accuracy, and utility can be satisfied with standard key-management  
5166 components (e.g., PKI), the use of those compliant components is encouraged. A developer  
5167 may choose to employ non-compliant key management as a result of security, accuracy, utility,  
5168 or cost considerations. However, such developments **should** conform as closely as possible to  
5169 established key-management recommendations.

5170 **10.1 Key Management Specification Description/Purpose**

5171 The Key Management Specification is the document that describes the key management  
5172 components that may be required to operate a cryptographic device throughout its lifetime.  
5173 Where applicable, the Key Management Specification also describes key management  
5174 components that are provided by a cryptographic device. The Key Management Specification  
5175 documents the capabilities that the cryptographic application requires from key sources (e.g.,  
5176 the Key Management Infrastructure (KMI) described in Part 2 of this *Recommendation for Key*  
5177 *Management* [\[SP800-57, Part 2\]](#)).

Deleted: ).

5178 **10.2 Content of the Key Management Specification**

5179 The level of detail required for each section of the Key Management Specification can be  
5180 tailored, depending upon the complexity of the device or application for which the Key

5185 Management Specification is being written. The Key Management Specification **should**  
5186 contain a title page that includes the device identifier, and the developer’s or integrator’s  
5187 identifier. A revision page, a list of reference documents, a table of contents, and a definition of  
5188 abbreviations and acronyms page **should** also be included. The terminology used in a Key  
5189 Management Specification **shall** be in accordance with the terms defined in appropriate NIST  
5190 standards and guidelines. Unless the information is tightly controlled, the Key Management  
5191 Specification **should not** contain proprietary or sensitive information. [Note: If the  
5192 cryptographic application is supported by a PKI, a statement to that effect **should** be included  
5193 in the appropriate Key Management Specification sections below.]

5194 **10.2.1 Cryptographic Application**

5195 A Cryptographic Application section provides a basis for the development of the rest of the  
5196 Key Management Specification. The Cryptographic Application section provides a brief  
5197 description of the cryptographic application or proposed employment of the cryptographic  
5198 device. This includes the purpose or use of the cryptographic device (or application of a  
5199 cryptographic device), and whether it is a new cryptographic device, a modification of an  
5200 existing cryptographic device, or an existing cryptographic device for which a Key  
5201 Management Specification does not exist. A brief description of the security services  
5202 (confidentiality, integrity [authentication](#), [source authentication](#), non-repudiation [support](#), access  
5203 control, and availability) that the cryptographic device/application provides **should** be  
5204 included. Information concerning long-term and potential interim key-management support  
5205 (key-management components) for the cryptographic application **should** be provided.

Deleted: , identification and authentication

5206 **10.2.2 Communications Environment**

5207 A Communications Environment section provides a brief description of the communications  
5208 environment in which the cryptographic device is designed to operate. Some examples of  
5209 communications environments include:

- 5210 1. Data networks ([e.g., intranet, Internet, VPN](#));
- 5211 2. Wired communications ([e.g., landline, dedicated or shared switching resources](#)); and
- 5212 3. Wireless communications ([e.g., cell phones](#)).

Deleted: ),

Deleted: ),

Deleted: satellite, radio frequency

5213 The environment may also include any anticipated access controls on communications  
5214 resources, data sensitivity, privacy issues, [etc.](#)

Deleted: non-repudiation requirements, etc.

5215 **10.2.3 Key Management Component Requirements**

5216 A Key Management Component Requirements section describes the types and logical structure  
5217 of the keying material required for the operation of the cryptographic device. Cryptographic  
5218 applications using public-key certificates ([e.g., X.509 certificates](#)) **should** describe the types of  
5219 certificates supported. The following information **should** be included:

Deleted: i.

- 5220 1. The different keying material classes or types required, supported, and/or generated  
5221 (e.g., for PKI: CA, signature, key establishment, and authentication);
- 5222 2. The key management algorithm(s) (the applicable **approved** algorithms);
- 5223 3. The keying material format(s) (reference any existing key specification, if known);
- 5224 4. The set of acceptable PKI policies (as applicable); [and](#)

5231 5. The tokens to be used.

5232 The description of the key-management component format may reference [a key specification](#)  
5233 [for](#) an existing cryptographic device. If the format of the key-management components is not  
5234 already specified, then the format and medium **should** be specified in the Key Management  
5235 Specification.

Deleted: key specification.

#### 5236 10.2.4 Key Management Component Generation

5237 The Key Management Specification **should** include a description of the requirements for the  
5238 generation of key-management components by the cryptographic device for which the Key  
5239 Management Specification is written. If the cryptographic device does not provide generation  
5240 capabilities, the key-management components that will be required from external sources  
5241 **should** be identified.

#### 5242 10.2.5 Key Management Component Distribution

5243 [When](#) a device supports the automated distribution of keying material, the Key Management  
5244 Specification **should** include a description of the distribution method(s) (where employed)  
5245 used for keying material supported by the device. The distribution plan may describe the  
5246 circumstances under which the key-management components are encrypted or [in plaintext](#),  
5247 their physical form (electronic, paper, etc.), and how they are identified during the distribution  
5248 process. In the case of a dependence on manual distribution, the dependence and any handling  
5249 assumptions regarding keying material **should** be stated.

Deleted: Where

Deleted: and transport encapsulation

Deleted: unencrypted

#### 5250 10.2.6 Keying Material Storage

5251 The Key Management Specification **should** address how the cryptographic device or  
5252 application for which the Key Management Specification is being written stores information,  
5253 and how the keying material is identified during its storage life (e.g., Distinguished Name).  
5254 The storage capacity capabilities for information **should** be included.

#### 5255 10.2.7 Access Control

5256 The Key Management Specification **should** address how access to the cryptographic device  
5257 components and functions is to be authorized, controlled, and validated to request, generate,  
5258 handle, distribute, store, and/or use keying material. Any use of passwords and personal  
5259 identification numbers (PINs) **should** be included. For PKI cryptographic applications, role  
5260 [and identity](#)-based privileging, and the use of any tokens **should** be described.

#### 5261 10.2.8 Accounting

5262 The Key Management Specification **should** describe any device or application support for [the](#)  
5263 accounting of the keying material. Any support for or outputs to logs used to support the  
5264 tracking of key-management component generation, distribution, storage, use and/or  
5265 destruction **should** be detailed. The use of appropriate privileging to support the control of  
5266 keying material that is used by the cryptographic application **should** also be described, in  
5267 addition to the directory capabilities used to support PKI cryptographic applications, if  
5268 applicable. The Key Management Specification **shall** identify where human and automated  
5269 tracking actions are required and where multi-party control is required, if applicable. [Section](#)  
5270 [9.1](#) of this Recommendation provides accountability guidance.

Deleted: Section 9.1

5276 **10.2.9 Compromise Management and Recovery**

5277 The Key Management Specification **should** address any support for the restoration of protected  
5278 communications in the event of the compromise of keying material used by the cryptographic  
5279 device/application. The recovery-process description **should** include the methods for re-  
5280 keying. For PKI cryptographic applications, the implementation of Certificate Revocation Lists  
5281 (CRLs) and Compromised Key Lists (CKLs) **should** be detailed. For system specifications, a  
5282 description of how certificates will be reissued and renewed within the cryptographic  
5283 application **should** also be included. General compromise-recovery guidance is provided in  
5284 [Section 9.3.4](#) of this Recommendation.

Deleted: Section 9.3.4

5285 **10.2.10 Key Recovery**

5286 The Key Management Specification **should** include a description of product support or system  
5287 mechanisms for effecting key recovery. Key recovery addresses how unavailable encryption  
5288 keys can be recovered. System developers **should** include a discussion of the generation,  
5289 storage, and access to long-term storage keys in the key-recovery-process description. The  
5290 process of transitioning from the current to future long-term storage keys **should** also be  
5291 described. General contingency planning guidance is provided in [Section 9.3.3](#) of this  
5292 Recommendation. Key recovery is treated in detail in [Appendix B](#).

Deleted: Section 9.3.3

Deleted: Appendix B, Key Recovery.

5293

5297 **APPENDIX A: Cryptographic and Non-cryptographic**  
5298 **Integrity and Source Authentication Mechanisms**

5299 Integrity and source authentication services are particularly important in protocols that include  
5300 key management. When integrity or source authentication services are discussed in this  
5301 Recommendation, they are afforded by “strong” cryptographic integrity or source  
5302 authentication mechanisms. Secure communications and key management are typically  
5303 provided using a communication protocol that offers certain services, such as integrity  
5304 protection or a "reliable" transport service<sup>59</sup>. However, the integrity protection or reliable  
5305 transport services of communication protocols are not necessarily adequate for cryptographic  
5306 applications, particularly for key management, and there might be confusion about the meaning  
5307 of terms such as “integrity”.

Deleted: communications

Deleted: communications

5308 All communication channels have some noise (i.e., unintentional errors inserted by the  
5309 transmission media), and other factors, such as network congestion, can cause network  
5310 packets<sup>60</sup> to be lost. Therefore, integrity protection and reliable transport services for  
5311 communication protocols are designed to function over a channel with certain worst-case noise  
5312 characteristics. Transmission bit errors are typically detected using 1) a non-cryptographic  
5313 checksum<sup>61</sup> to detect transmission errors in a packet, and 2) a packet counter that is used to  
5314 detect lost packets. A receiving entity that detects damaged packets (i.e., packets that contain  
5315 bit errors) or lost packets may request the sender to retransmit them. The non-cryptographic  
5316 checksums are generally effective at detecting transmission noise. For example, the common  
5317 CRC-32 checksum algorithm used in local-area network applications detects all error bursts  
5318 with a span of less than 32 bits, and detects longer random bursts with a 2<sup>-32</sup> failure probability.  
5319 However, the non-cryptographic CRC-32 checksum does not detect the swapping of 32-bit  
5320 message words, and specific errors in particular message bits cause predictable changes in the  
5321 CRC-32 checksum. The sophisticated attacker can take advantage of this to create altered  
5322 messages that pass the CRC-32 integrity checks, even, in some cases, when the message is  
5323 encrypted.

Deleted: communications

Deleted: communications

5324 Forward error-correcting codes are a subset of non-cryptographic checksums that can be used  
5325 to correct a limited number of errors without retransmission. These codes may be used as  
5326 checksums, depending on the application and noise properties of the channel.

5327 Cryptographic integrity authentication mechanisms, (e.g., MACs or digital signatures), on the  
5328 other hand, protect against an active, intelligent attacker who might attempt to disguise his  
5329 attack as noise. Typically, the bits altered by the attacker are not random; they are targeted at

Deleted: .

<sup>59</sup> A means of transmitting information within a network using protocols that provide assurances that the information is received correctly.

<sup>60</sup> A formatted unit of data used to send messages across a network. Messages may be divided into multiple packets for transmission efficiency.

<sup>61</sup> Checksum: an algorithm that uses the bits in the transmission to create a checksum value. The checksum value is normally sent in the transmission. The receiver re-computes the checksum value using the bits in the received transmission, and compares the received checksum value with the computed value to determine whether or not the transmission was correctly received. A non-cryptographic checksum algorithm uses a well-known algorithm without secret information (i.e., a cryptographic key).

5335 | system properties and vulnerabilities. Cryptographic integrity [authentication](#) mechanisms are  
 5336 | effective in detecting random noise events, but they also detect the more systematic deliberate  
 5337 | attacks. Cryptographic hash functions, such as SHA-256 are designed to make every bit of the  
 5338 | hash value a complex, nonlinear function of every bit of the message text, and to make it  
 5339 | impractical to find two messages that hash to the same value. On average, it is necessary to  
 5340 | perform  $2^{128}$  SHA-256 hash operations to find two messages that hash to the same value, and it  
 5341 | is much harder to find another message whose SHA-256 hash is the same value as the hash of  
 5342 | any given message. Cryptographic message authentication code (MAC) algorithms employ  
 5343 | hash functions or symmetric encryption algorithms and [keys](#) to authenticate the source of a  
 5344 | message [and to protect the integrity of a message](#) (i.e., [to detect errors](#)). Digital signatures use  
 5345 | public-key algorithms and hash functions to provide both [integrity and source](#) authentication  
 5346 | [services](#). Compared to non-cryptographic integrity or [source](#) authentication mechanisms, these  
 5347 | cryptographic services are usually computationally more expensive; this seems to be  
 5348 | unavoidable, since cryptographic protections must also resist deliberate attacks by  
 5349 | knowledgeable adversaries with substantial resources.

Deleted: a key

Deleted: , as well as

Deleted: its

Deleted: and integrity

5350 | Cryptographic and non-cryptographic integrity [authentication](#) mechanisms may be used  
 5351 | together. For example, consider the TLS protocol (see [\[SP800-52\]](#)). In TLS, a client and a  
 5352 | server can authenticate [the identity of](#) each other, establish a shared "master key" and transfer  
 5353 | encrypted payload data. Every step in the entire TLS protocol run is protected by cryptographic  
 5354 | integrity and [source](#) authentication mechanisms, and the payload is usually encrypted. Like  
 5355 | most cryptographic protocols, TLS will detect any attack or noise event that alters any part of  
 5356 | the protocol run with a given probability. However, TLS has no error-recovery protocol. If an  
 5357 | error is detected, the protocol run is simply terminated. Starting a new TLS protocol run is  
 5358 | quite expensive. Therefore, TLS requires a "reliable" transport service, typically the Internet  
 5359 | Transport Control Protocol (TCP), to handle and recover from ordinary network transmission  
 5360 | errors. TLS will detect errors caused by an attack or noise event, but has no mechanism to  
 5361 | recover from them. TCP will generally detect such errors on a packet-by-packet basis and  
 5362 | recover from them by retransmission of individual packets, before delivering the data to TLS.  
 5363 | Both TLS and TCP have integrity [authentication](#) mechanisms, but a sophisticated attacker  
 5364 | could easily fool the weaker non-cryptographic checksums of TCP. However, because of the  
 5365 | cryptographic integrity [authentication](#) mechanism provided in TLS, the attack is thwarted.

Deleted: Part 3).

5366 | There are some interactions between cryptographic and non-cryptographic integrity or error-  
 5367 | correction mechanisms that users and protocol designers must take into account. For example,  
 5368 | many encryption modes expand ciphertext errors: a single bit error in the ciphertext can change  
 5369 | an entire block or more of the resulting plaintext. If forward error correction is applied before  
 5370 | encryption, and errors are inserted in the ciphertext during transmission, the error expansion  
 5371 | during the decryption might "overwhelm" the error-correction mechanism, making the errors  
 5372 | uncorrectable. Therefore, it is preferable to apply the forward error-correction mechanism after  
 5373 | the encryption process. This will allow the correction of errors by the receiving entity's system  
 5374 | before the ciphertext is decrypted, resulting in "correct" plaintext.

5375 | Interactions between cryptographic and non-cryptographic mechanisms can also result in  
 5376 | security vulnerabilities. One classic way this occurs is with protocols that use stream ciphers<sup>62</sup>

<sup>62</sup> Stream ciphers encrypt and decrypt one element (e.g., bit or byte) at a time. There are no **approved** algorithms specifically designated as stream ciphers. However, some of the cryptographic modes defined in [\[SP 800-38\]](#) can be used with a symmetric block cipher algorithm, such as AES, to perform the function of a stream cipher.

Deleted: [SP 800-38]

September 2015

5382 with non-cryptographic checksums (e.g. CRC-32) that are computed over the plaintext data  
5383 and that acknowledge good packets. An attacker can copy the encrypted packet, selectively  
5384 modify individual ciphertext bits, selectively change bits in the CRC, and then send the packet.  
5385 Using the protocol's acknowledgement mechanism, the attacker can determine when the CRC  
5386 is correct, and therefore, determine certain bits of the underlying plaintext. At least one widely  
5387 used wireless-encryption protocol has been broken with such an attack.

5388

**Deleted:** wireless

## 5390 APPENDIX B: Key Recovery

5391 Federal agencies have a responsibility to protect the information contained in, processed by  
 5392 and transmitted between their information technology systems. Cryptographic techniques are  
 5393 often used as part of this process. These techniques are used to provide confidentiality,  
 5394 integrity, authentication, source authentication, non-repudiation, support or access control.  
 5395 Policies **shall** be established to address the protection and continued accessibility of  
 5396 cryptographically protected information, and procedures **shall** be in place to ensure that the  
 5397 information remains viable during its lifetime. When cryptographic keying material is used to  
 5398 protect the information, this same keying material may need to be available to remove (e.g.,  
 5399 decrypt) or verify (e.g., verify the MAC) those protections.

Deleted: assurance of

5400 In many cases, the keying material used for cryptographic processes might not be readily  
 5401 available. This might be the case for a number of reasons, including:

- 5402 1. The cryptoperiod of the key has expired, and the keying material is no longer in  
 5403 operational storage,
- 5404 2. The keying material has been corrupted (e.g., the system has crashed or a virus has  
 5405 modified the saved keying material in operational storage), or
- 5406 3. The owner of the keying material is not available, and the owner's organization needs  
 5407 to obtain the plaintext information.

5408 In order to have this keying material available when required, the keying material needs to be  
 5409 saved somewhere or to be constructible (e.g., derivable) from other available keying material.  
 5410 The process of re-acquiring the keying material is called key recovery. Key recovery is often  
 5411 used as one method of information recovery when the plaintext information needs to be  
 5412 recovered from encrypted information. However, keying material or other related information  
 5413 may need to be recovered for other reasons, such as the corruption of keying material in normal  
 5414 operational storage (see Section 8.2.1), e.g., the verification of MACs for archived documents.  
 5415 Key recovery may also be appropriate for situations in which it is easier or faster to recover the  
 5416 keying material than it is to generate and distribute new keying material.

Deleted: Section 8.2.1),

5417 However, there are applications that may not need to save the keying material for an extended  
 5418 time because of other procedures to recover an operational capability when the keying material  
 5419 or the information protected by the keying material becomes inaccessible. Applications of this  
 5420 type could include telecommunications where the transmitted information could be resent, or  
 5421 applications that could quickly derive, or acquire and distribute new keying material.

5422 It is the responsibility of an organization to determine whether or not the recovery of keying  
 5423 material is required for their application. The decision as to whether key recovery is required  
 5424 **should** be made on a case-by-case basis, and this decision **should** be reflected in the Key  
 5425 Management Policy and the Key Management Practices Statement (see [SP800-57, Part 2]). If  
 5426 the decision is made to provide key recovery, the appropriate method of key recovery **should**  
 5427 be selected, designed and implemented, based on the type of keying material to be recovered;  
 5428 an appropriate entity needs to be selected to maintain the backup or archive database and  
 5429 manage the key recovery process.

Deleted: Part 2).

5433 If the decision is made to provide key recovery for a key, all information associated with that  
 5434 key **shall** also be recoverable (see [Table 5 in Section 6](#)).

**Deleted:** Table 5 in Section 6).

5435 **B.1 Recovery from Stored Keying Material**

5436 The primary purpose of [the back](#) up or archiving [of](#) keying material is to be able to recover that  
 5437 material when it is not otherwise available. For example, encrypted information cannot be  
 5438 transformed [back](#) into plaintext information if the decryption key is lost or modified; the  
 5439 integrity of data cannot be [authenticated](#) if the key used to verify the integrity of that data is not  
 5440 available. The key recovery process retrieves the keying material from backup or archive  
 5441 storage, and places it either in a device or module, or in other immediately accessible storage  
 5442 (see [Section 8.3.1](#)).

**Deleted:** backing

**Deleted:** determined

**Deleted:** Section 8.3.1).

5443 **B.2 Recovery by Reconstruction of Keying Material**

5444 Some keying material may be recovered by reconstructing or re-deriving the keying material  
 5445 from other available keying material – the “base” keying material (e.g., a master key for a key-  
 5446 derivation method). The base keying material **shall** be available in normal operational storage  
 5447 (see [Section 8.2.1](#)), backup storage (see [Section 8.2.2.1](#)) or archive storage (see [Section 8.3.1](#)).

**Deleted:** .

**Deleted:** Section 8.2.1),

**Deleted:** Section 8.2.2.1)

**Deleted:** Section 8.3.1).

5448 **B.3 Conditions Under Which Keying Material Needs to be Recoverable**

5449 The decision as to whether to back up or archive keying material for possible key recovery  
 5450 **should** be made on a case-by-case basis. The decision **should** be based on [the list provided in](#)  
 5451 [Section 8.2.2.2](#).

**Deleted:** :¶  
 1. The type of key (e.g., signing private key, long-term data-encryption key),¶  
 2. . The application in which

5452 When the key-recovery operation is requested by the key’s owner, the following actions **shall**  
 5453 be taken:

**Deleted:** key will be used (e.g., interactive communications, file storage),¶  
 3. Whether the key is “owned” by the local entity (e.g., a private key) or by another entity (e.g., the other entity’s public key) or is shared (e.g., a symmetric data-encryption key shared by two entities),¶  
 4. . The role of the entity in a communication (e.g., sender or receiver), ¶  
 5. The algorithm or computation in which the key will be used (e.g., does the entity have the necessary information to perform a given computation if the key were to be recovered), and¶  
 6. . The value of the information protected by the keying material, and the consequences of the loss of the keying material.¶  
 The factors involved in a decision for or against key recovery **should** be carefully assessed. The trade-offs include continuity of operations, versus the risk of possibly exposing the keying material and the information it protects if control of the keying material is lost.

5454 1. If the key is lost with the possibility of having been compromised, then the key **shall** be  
 5455 replaced as soon as possible after recovery in order to limit the exposure of the  
 5456 recovered key and the data it protects (see [Section 8.2.3.1](#)). This requires reapplying the  
 5457 protection on the protected data using the new key. For example, suppose that the key  
 5458 that was used to encrypt data ( $Key_A$ ) has been misplaced in a manner in which it could  
 5459 have been compromised. As soon as possible after  $Key_A$  is recovered,  $Key_A$  **shall** be used  
 5460 to decrypt the data, and the data **shall** be re-encrypted under a new key ( $Key_B$ ).  $Key_B$   
 5461 **shall** have no relationship to  $Key_A$  (e.g.,  $Key_B$  **shall not** be an update of  $Key_A$ ).

5462 2. If the key becomes inaccessible or has been modified, but compromise is not suspected,  
 5463 then the key may be recovered. No further action is required (e.g., re-encrypting the  
 5464 data). For example, if the key becomes inaccessible because the system containing the  
 5465 key crashes, or the key is inadvertently overwritten, and a compromise is not suspected,  
 5466 then the key may simply be restored.

**Deleted:** Section 8.2.3.1).

**Deleted:** ( $Key_A$ )

5467 The following subsections provide discussions to assist an organization in determining whether  
 5468 or not key recovery is needed. Although the following discussions address only the  
 5469 recoverability of keys, any related information (e.g., [the metadata associated with the key](#))  
 5470 **shall** also be recoverable.

5507 **B.3.1 Signature Key Pairs**

5508 The private key of a signature key pair (the private signature key) is used by the owner of the  
 5509 key pair to apply digital signatures to information. The corresponding public key (the public  
 5510 signature-verification key) is used by relying entities to verify the digital signature.

Deleted: associated

5511 **B.3.1.1 Private Signature Keys**

5512 Private signature keys **shall not** be archived (see Table 9 in Section 8.3.1). Key backup is not  
 5513 usually desirable for the private key of a signing key pair, since support for the non-  
 5514 repudiability of the signature comes into question. However, exceptions may exist. For  
 5515 example, replacing the private signature key and having its corresponding public signature-  
 5516 verification key distributed (in accordance with Section 8.1.5.1) in a timely manner may not be  
 5517 possible under some circumstances, so recovering the private signature key from backup  
 5518 storage may be justified. This may be the case, for example, for the private signature key of a  
 5519 CA.

Deleted: Table 9 in Section 8.3.1.

Deleted: associated

Deleted: Section 8.1.5.1)

5520 If backup is considered for the private signature key, an assessment **should** be made as to its  
 5521 importance and the time needed to recover the key, as opposed to the time needed to generate a  
 5522 new key pair, and certify and distribute a new public signature-verification key. If a private  
 5523 signature key is backed up, the private signature key **shall** be recovered using a highly secure  
 5524 method. Depending on circumstances, the key **should** be recovered for immediate use only,  
 5525 and then **shall** be replaced as soon after the recovery process as possible.

Moved (insertion) [10]

5526 Instead of backing up the private signature key, a second private signature key and  
 5527 corresponding public key could be generated, and the public key distributed in accordance with  
 5528 Section 8.1.5.1 for use if the primary private signature key becomes unavailable.

Deleted: associated

Moved up [10]: If backup is considered for the private signature key, an assessment **should** be made as to its importance and the time needed to recover the key, as opposed to the time needed to generate a new key pair, and certify and distribute a new public signature-verification key.

5529 **B.3.1.2 Public Signature-verification Keys**

Deleted: Section 8.1.5.1

5530 It is appropriate to backup or archive a public signature-verification key for as long as required  
 5531 in order to verify the information signed by the corresponding private signature key. In the case  
 5532 of a public key that has been certified (e.g., by a Certification Authority), saving the public-key  
 5533 certificate would be an appropriate form of storing the public key; backup or archive storage  
 5534 may be provided by the infrastructure (e.g., by a certificate repository). The public key **should**  
 5535 be stored in backup storage until the end of the private key's cryptoperiod, and **should** be  
 5536 stored in archive storage as long as required for the verification of signed data.

Deleted: A private signature key **shall not** be archived.¶

Deleted: associated

5537 **B.3.2 Symmetric Authentication Keys**

5538 A symmetric authentication key is used to provide assurance of the integrity and source of  
 5539 information. A symmetric authentication key can be used:

- 5540 1. By an originator to create a message authentication code (MAC) that can be verified at  
 5541 a later time to determine the integrity (and possibly the source) of the authenticated  
 5542 information; the authenticated information and its MAC could then be stored for later  
 5543 retrieval or transmitted to another entity,
- 5544 2. By an entity that retrieves the authenticated information and the MAC from storage to  
 5545 determine the integrity of the stored information (Note: This is not a communication  
 5546 application),

Deleted: authenticity or

- 5563 3. Immediately upon receipt by a receiving entity to determine the integrity of transmitted  
5564 information and the source of that information (the received MAC and the associated  
5565 authenticated information may or may not be subsequently stored), or
- 5566 4. By a receiving and retrieving entity to determine the integrity and source of information  
5567 that has been received and subsequently stored using the same MAC (and the same  
5568 authentication key); checking the MAC may not be performed prior to storage.

Deleted: is

5569 For each of the above cases, a decision to provide a key recovery capability **should** be made,  
5570 based on the following considerations.

5571 **In case 1**, the symmetric authentication key need not be backed up or archived if the  
5572 originator can establish a new authentication key prior to computing the MAC, making  
5573 the key available to any entity that would need to subsequently verify the information  
5574 that is authenticated using this new key. If a new authentication key cannot be obtained  
5575 in a timely manner, then the authentication key **should** be backed up or archived.

5576 **In case 2**, the symmetric authentication key **should** be backed up or archived for as  
5577 long as the integrity and source of the information needs to be determined.

5578 **In case 3**, the symmetric authentication key need not be backed up or archived if the  
5579 authentication key can be resent to the recipient. In this case, establishing and  
5580 distributing a new symmetric authentication key, rather than reusing the “lost” key, is  
5581 also acceptable; a new MAC would need to be computed on the information using the  
5582 new authentication key. Otherwise, the symmetric authentication key **should** be backed  
5583 up. Archiving the authentication key is not appropriate if the MAC and the  
5584 authenticated information are not subsequently stored, since the use of the key for both  
5585 applying and checking the MAC would be discontinued at the end of the key's  
5586 cryptoperiod. If the MAC and the authenticated information are subsequently stored,  
5587 then the symmetric authentication key **should** be backed up or archived for as long as  
5588 the integrity and source of the information needs to be determined.

5589 **In case 4**, the symmetric authentication key **should** be backed up or archived for as  
5590 long as the integrity and source of the information needs to be determined.

5591 The symmetric authentication key may be stored in backup storage for the cryptoperiod of the  
5592 key, and in archive storage until no longer required. If the authentication key is recovered by  
5593 reconstruction, the “base” key (e.g., the master key for a key-derivation method) may be stored  
5594 in normal operational storage or backup storage for the cryptoperiod of the base key, and in  
5595 archive storage until no longer required.

5596 **B.3.3 Authentication Key Pairs**

5597 A public authentication key is used by a receiving entity to obtain assurance of the identity of  
5598 the originating entity. The corresponding private authentication key is used by the originating  
5599 entity to provide this assurance to a receiving entity by computing a digital signature on the  
5600 information. This key pair may not provide support for non-repudiation.

Deleted: when executing an authentication mechanism. The associated

5601 **B.3.3.1 Public Authentication Keys**

5602 It is appropriate to store a public authentication key in either backup or archive storage for as  
5603 long as required to verify the identity of the entity that is participating in an authenticated  
5604 communication session.

Deleted: authenticity

Deleted: data

Deleted: was

Deleted: by the associated private authentication key

5613 In the case of a public key that has been certified (e.g., by a Certification Authority), saving the  
5614 public-key certificate would be an appropriate form of storing the public key; backup or  
5615 archive storage may be provided by the infrastructure (e.g., by a certificate repository). The  
5616 public key may be stored in backup storage until the end of the private key's cryptoperiod, and  
5617 may be stored in archive storage as long as required.

5618 **B.3.3.2 Private Authentication Keys**

5619 The private key is used to establish the identity of an entity who is participating in an  
5620 authenticated communication session. The private authentication key need not be backed up if  
5621 a new key pair can be generated and distributed in accordance with Section 8.1.5.1 in a timely  
5622 manner. However, if a new key pair cannot be generated quickly, the private key **should**  
5623 be stored in backup storage during the cryptoperiod of the private key. The private key **shall not**  
5624 be stored in archive storage.

5625 **B.3.4 Symmetric Data-Encryption Keys**

5626 A symmetric data-encryption key is used to protect the confidentiality of stored or transmitted  
5627 information or both. The same key is used initially to encrypt the plaintext information to be  
5628 protected, and later to decrypt the encrypted information (i.e., the ciphertext), thus obtaining  
5629 the original plaintext.

5630 The key needs to be available for as long as any information that is encrypted using that key  
5631 may need to be decrypted. Therefore, the key **should** be backed up or archived during this  
5632 period.

5633 In order to allow key recovery, the symmetric data-encryption key **should** be stored in backup  
5634 storage during the cryptoperiod of the key, and **should** be stored in archive storage, if required.

5635 In many cases, the key is protected and stored with the encrypted data. When archived, the key  
5636 is wrapped (i.e., encrypted) by an archive-encryption key or by a symmetric key-wrapping key  
5637 that is wrapped by a protected archive-encryption key.

5638 A symmetric-data encryption key that is used only for transmission is used by an originating  
5639 entity to encrypt information, and by the receiving entity to decrypt the information  
5640 immediately upon receipt. If the data-encryption key is lost or corrupted, and a new data-  
5641 encryption key can be easily obtained by the originating and receiving entities, then the key  
5642 need not be backed up. However, if the key cannot be easily replaced by a new key, then the  
5643 key **should** be backed up if the information to be exchanged is of sufficient importance. The  
5644 data-encryption key may not need to be archived when used for transmission only.

5645 **B.3.5 Symmetric Key-Wrapping Keys**

5646 A symmetric key-wrapping key is used to wrap (i.e., encrypt) keying material that is to be  
5647 protected, and may be used to protect multiple sets of keying material. The protected keying  
5648 material is then transmitted or stored or both.

5649 If a symmetric key-wrapping key is used only to transmit keying material, and the key-  
5650 wrapping key becomes unavailable (e.g., is lost or corrupted), it may be possible to either  
5651 resend the key-wrapping key, or to establish a new key-wrapping key and use it to resend the  
5652 keying material. If this is possible within a reasonable timeframe, backup of the key-wrapping  
5653 key is not necessary. If the key-wrapping key cannot be resent, or a new key-wrapping key

**Deleted:** When  
**Deleted:** only for  
**Deleted:** authentication  
**Deleted:** transmitted data, whether or not the  
**Deleted:** data is subsequently stored,  
**Deleted:** Section 8.1.5.1  
**Deleted:** When the private authentication key is used to protect stored information only, the private authentication key **should not** be backed up if a new key pair can be generated. However, if a new key pair cannot be generated, the private key **should** be stored in backup storage during the cryptoperiod of the private key. The private key **shall not** be stored in archive storage.¶

**Deleted:** However, at some time, the strength of the cryptographic protection could be reduced or lost completely; for example, the encryption algorithm may no longer offer adequate security, or the symmetric key may have been compromised. If the encryption algorithm or the key no longer provide the required security (e.g., the length of the key is no longer considered adequate, or the key has been compromised), then the cryptographic protection **shall** be regarded as inadequate. Appropriate storage systems are being developed that employ cryptographic timestamps to store sensitive data beyond the security life of the encryption algorithm or the data-encryption key (e.g., to provide assurance about the date of the encryption process, so that it can be determined whether the algorithm and key provided sufficient protection at that time, as well as to provide assurance that the encrypted data has been physically protected from compromise).

5687 cannot be readily obtained, backup of the key-wrapping key **should** be considered. The archive  
5688 of a key-wrapping key that is only used to transmit keying material may not be necessary.

5689 If a symmetric key-wrapping key is used to protect keying material in storage, then the key-  
5690 wrapping key **should** be backed up or archived for as long as the protected keying material  
5691 may need to be accessed.

5692 **B.3.6 Random Number Generation Keys**

5693 A key used for deterministic random bit generation **shall not** be backed up or archived. If this  
5694 key is lost or modified, it **shall** be replaced with a new key.

5695 **B.3.7 Symmetric Master Keys**

5696 A symmetric master key is normally used to derive one or more other keys. It **shall not** be used  
5697 for any other purpose.

5698 The determination as to whether or not a symmetric master key needs to be backed up or  
5699 archived depends on a number of factors:

- 5700 1. How easy is it to establish a new symmetric master key? If the master key is distributed  
5701 manually (e.g., in smart cards or in hard copy by receipted mail), the master key **should**  
5702 be backed up or archived. If a new master key can be easily and quickly established  
5703 using automated key-establishment protocols, then the backup or archiving of the  
5704 master key may not be necessary or desirable, depending on the application.
- 5705 2. Are the derived keys recoverable without the use of the symmetric master key? If the  
5706 derived keys do not need to be backed up or archived (e.g., because of their use) or  
5707 recovery of the derived keys does not depend on reconstruction from the master key  
5708 (e.g., the derived keys are stored in an encrypted form), then the backup or archiving of  
5709 the master key may not be desirable. If the derived keys need to be backed up or  
5710 archived, and the method of key recovery requires a reconstruction of the derived key  
5711 from the master key, then the master key **should** be backed up or archived.

5712 **B.3.8 Key-Transport Key Pairs**

5713 A key-transport key pair may be used to transport keying material from an originating entity to  
5714 a receiving entity during communications. The transported keying material could be stored in  
5715 its encrypted form for decryption at a later time. The originating entity in a communication  
5716 uses the public key to encrypt the keying material; the receiving entity (or the entity retrieving  
5717 the stored keying material) uses the private key to decrypt the encrypted keying material.

5718 **B.3.8.1 Private Key-Transport Keys**

5719 If a key-transport key pair is used during communications without storing the encrypted keying  
5720 material, then the private key-transport key does not need to be backed up if a replacement key  
5721 pair can be generated and distributed in a timely fashion. Alternatively, one or more additional  
5722 key pairs could be made available (i.e., already generated and distributed). Otherwise, the  
5723 private key **should** be backed up. The private key-transport key may be archived.

5724 If the transported keying material is stored in its encrypted form, then the private key-transport  
5725 key **should** be backed up or archived for as long as the protected keying material may need to  
5726 be accessed.

**Deleted:** However, at some time, the strength of the key-wrapping mechanism may be reduced or lost completely; for example, the key-wrapping algorithm may no longer offer adequate security, or the key-wrapping key may have been compromised. If the wrapping algorithm or the key-wrapping key no longer provide the required security (e.g., the length of the key is no longer considered adequate, or the key has been compromised), then the cryptographic protection **shall** be regarded as inadequate. Appropriate storage systems are being developed that employ cryptographic timestamps to store sensitive data beyond the security life of the key-wrapping algorithm or its key-wrapping keys (e.g., to provide assurance about the date of the wrapping process, so that it can be determined whether the key-wrapping algorithm and key-wrapping key provided sufficient protection at that time, as well as to provide assurance that the wrapped keying material data has been physically protected from compromise).

**Deleted:** , or to protect

**Deleted:** while

**Deleted:** storage.

**Deleted:** (or the entity initiating the storage of the keying material)

**Deleted:** only

**Deleted:** transport key pair

**Deleted:** used during storage

5756 **B.3.8.2 Public Key Transport Keys**

5757 Backup or archiving of the public key may be done, but may not be necessary.

5758 If the sending entity (the originating entity in a communications) loses the public key-transport  
5759 key or determines that the key has been corrupted, the key can be reacquired from the key pair  
5760 owner or by obtaining the public-key certificate containing the public key (if the public key  
5761 was certified).

5762 If the entity that applies the cryptographic protection to keying material that is to be stored  
5763 determines that the public key-transport key has been lost or corrupted, the entity may recover  
5764 in one of the following ways:

- 5765 1. If the public key has been certified and is stored elsewhere within the infrastructure,  
5766 then the certificate can be requested.
- 5767 2. If some other entity knows the public key (e.g., the owner of the key pair), the key can  
5768 be requested from this other entity.
- 5769 3. If the private key is known, then the public key can be recomputed.
- 5770 4. A new key pair can be generated.

5771 **B.3.9 Symmetric Key Agreement Keys**

5772 Symmetric key-agreement keys are used to establish keying material (e.g., symmetric key-  
5773 wrapping keys, symmetric data-encryption keys, or symmetric authentication keys). Each key-  
5774 agreement key is shared between two or more entities. If these keys are distributed manually  
5775 (e.g., in a key loading device or by receipted mail), then the symmetric key-agreement key  
5776 **should** be backed up. If an automated means is available for quickly establishing new keys  
5777 (e.g., a key-transport mechanism can be used to establish a new symmetric key-agreement  
5778 key), then a symmetric key-agreement key need not be backed up.

5779 Symmetric key-agreement keys may be archived.

5780 **B.3.10 Static Key-Agreement Key Pairs**

5781 Static key-agreement key pairs are used to establish shared secrets between entities ([see](#)  
5782 [\[SP800-56A\]](#) and [\[SP800-56B\]](#)), [sometimes](#) in conjunction with ephemeral key pairs (see  
5783 [\[SP800-56A\]](#)). Each entity uses its private key-agreement key(s), the other entity's public key-  
5784 agreement key(s) and possibly its [own](#) public key-agreement key(s) to determine the shared  
5785 secret. The shared secret is subsequently used to derive shared keying material. Note that in  
5786 some key-agreement schemes, one or more of the entities may not have a static key-agreement  
5787 pair (see [\[SP800-56A\]](#) and [\[SP800-56B\]](#)).

5788 **B.3.10.1 Private Static Key-Agreement Keys**

5789 If the private static key-agreement key cannot be replaced in a timely manner, or if it needs to  
5790 be retained in order to recover encrypted stored data, then the private key **should** be backed up  
5791 in order to continue operations. The private key may be archived.

5792 **B.3.10.2 Public Static Key Agreement Keys**

5793 If an entity determines that the public static key-agreement key is lost or corrupted, the entity  
5794 may recover in one of the following ways:

Deleted: . often  
Deleted: ] and [SP800-56B

- 5797 1. If the public key has been certified and is stored elsewhere within the infrastructure,  
5798 then the certificate can be requested.
- 5799 2. If some other entity knows the public key (e.g., the other entity is the owner of the key  
5800 pair), the key can be requested from this other entity.
- 5801 3. If the private key is known, then the public key can be recomputed.
- 5802 4. If the entity is the owner of the key pair, a new key pair can be generated and  
5803 distributed.

5804 If none of these alternatives are possible, then the public static key-agreement key **should** be  
5805 backed up. The public key may be archived.

5806 **B.3.11 Ephemeral Key Pairs**

5807 Ephemeral key-agreement keys are generated and distributed during a single key-agreement  
5808 process (e.g., at the beginning of a communication session) and are not reused. These key pairs  
5809 are used to establish a shared secret (often in combination with static key pairs); the shared  
5810 secret is subsequently used to derive shared keying material. Not all key-agreement schemes  
5811 use ephemeral key pairs, and when used, not all entities have an ephemeral key pair (see  
5812 [\[SP800-56A\]](#)).

Deleted: [SP800-56A].

5813 **B.3.11.1 Private Ephemeral Keys**

5814 Private ephemeral keys **shall not**<sup>63</sup> be backed up or archived. If the private ephemeral key is  
5815 lost or corrupted, a new key pair **shall** be generated, and the new public ephemeral key **shall** be  
5816 provided to the other participating entity in the key-agreement process.

5817 **B.3.11.2 Public Ephemeral Keys**

5818 Public ephemeral keys may be backed up or archived. This [may](#) allow the reconstruction of the  
5819 established keying material, as long as the private ephemeral keys are not required in the key-  
5820 agreement computation.

Deleted: will

5821 **B.3.12 Symmetric Authorization Keys**

5822 Symmetric authorization keys are used to provide privileges to an entity (e.g., access to certain  
5823 information or authorization to perform certain functions). [The](#) loss of these keys will deny the  
5824 privileges (e.g., prohibit access and disallow [the](#) performance of these functions). If the  
5825 authorization key is lost or corrupted and can be replaced in a timely fashion, then the  
5826 authorization key need not be backed up. A symmetric authorization key **shall not** be archived.

5827 **B.3.13 Authorization Key Pairs**

5828 Authorization key pairs are used to [determine the](#) privileges [that](#) an entity [may assume](#). The  
5829 private key is used to establish the "right" to the privilege; the public key is used to determine  
5830 that the entity actually has the right to the privilege.

Deleted: provide

Deleted: to

<sup>63</sup> SP 800-56A states that the private ephemeral keys **shall** be destroyed immediately after use. This implies that the private ephemeral keys **shall not** be backed up or archived.

5835 **B.3.13.1 Private Authorization Keys**

5836 | The loss of the private authorization key will deny privileges (e.g., prohibit access and disallow  
5837 | the performance of certain functions requiring authorization). If the private key is lost or  
5838 | corrupted and can be replaced in a timely fashion, then the private key need not be backed up.  
5839 | Otherwise, the private key **should** be backed up. The private key **shall not** be archived.

Deleted: the

Deleted: these

5840 **B.3.13.2 Public Authorization Keys**

5841 | If the authorization key pair can be replaced in a timely fashion (i.e., by a regeneration of the  
5842 | key pair and secure distribution of the private key to the entity seeking authorization), then the  
5843 | public authorization key need not be backed up. Otherwise, the public key **should** be backed  
5844 | up. There is no restriction about archiving the public key.

5845 **B.3.14 Other Cryptographically Related Material**

5846 | Like keys, other cryptographically related material may need to be backed up or archived,  
5847 | depending on its use.

5848 **B.3.14.1 Domain Parameters**

5849 | Domain parameters are used in conjunction with some public key algorithms to generate key  
5850 | pairs. They are also used with key pairs to create and verify digital signatures, or to establish  
5851 | keying material. The same set of domain parameters is often, but not always, used by a large  
5852 | number of entities.

Deleted: ,

Deleted: , or to generate random numbers

5853 | When an entity (entity A) generates new domain parameters, these domain parameters are used  
5854 | in subsequent digital signature generation or key-establishment processes. The domain  
5855 | parameters need to be provided to other entities that need to verify the digital signatures or  
5856 | with whom keys will be established. If the entity (entity A) determines that its copies of the  
5857 | domain parameters have been lost or corrupted, and if the new domain parameters cannot be  
5858 | securely distributed in a timely fashion, then the domain parameters **should** be backed up or  
5859 | archived.

Deleted: Another entity (entity B) **should** backup or archive entity A's domain parameters until no longer required unless the domain parameters can be otherwise obtained (e.g., from entity A).

5860 | When the same set of domain parameters are used by multiple entities, the domain parameters  
5861 | **should** be backed up or archived until no longer required unless the domain parameters can be  
5862 | otherwise obtained (e.g., from a trusted source).

5863 **B.3.14.2 Initialization Vectors (IVs)**

5864 | IVs are used by several modes of operation during the encryption or authentication of  
5865 | information using block cipher algorithms. IVs are often stored with the data that they protect.  
5866 | If not, stored with the data, IVs **should** be backed up or archived as long as the information  
5867 | protected using those IVs needs to be processed (e.g., decrypted or authenticated).

Deleted: , they

5868 **B.3.14.3 Shared Secrets**

5869 | Shared secrets are generated by each entity participating in a key-agreement process. The  
5870 | shared secret is then used to derive the shared keying material to be used in subsequent  
5871 | cryptographic operations. Shared secrets may be generated during interactive communications  
5872 | (e.g., where both entities are online) or during non-interactive communications (e.g., in store  
5873 | and forward applications).

5874 | A shared secret **shall not** be backed up or archived.

5884 **B.3.14.4** **RBG Seeds**

5885 RBG seeds are used in the generation of deterministic random bits that need to remain secret.  
5886 These seeds **shall not** be shared with other entities. RBG seeds **shall not** be backed up or  
5887 archived.

Deleted: RNG  
Deleted: RNG  
Deleted: RNG

5888 **B.3.14.5** **Other Public and Secret Information**

5889 Public and secret information is often used during key establishment. The information may  
5890 need to be available to determine the keys that are needed to process cryptographically  
5891 protected information (e.g., to decrypt or authenticate); therefore, the information **should** be  
5892 backed up or archived until no longer needed to process the protected information.

5893 **B.3.14.6** **Intermediate Results**

5894 The intermediate results of a cryptographic operation **shall not** be backed up or archived.

5895 **B.3.14.7** **Key Control Information**

5896 Key control information is used, for example, to determine the keys and other information to  
5897 be used to process cryptographically protected information (e.g., decrypt or authenticate), to  
5898 identify the purpose of a key, or to identify the entities that share the key (see [Section 6.2.3](#)).  
5899 This information is contained in the key's metadata (see [Section 6.2.3.1](#)).

Deleted: Section 6.2.3).  
Deleted: Section 6.2.3.1).

5900 Key control information **should** be backed up or archived for as long as the associated key  
5901 needs to be available.

5902 **B.3.14.8** **Random Numbers**

5903 Random numbers are generated by random number generators. The backup or archiving of a  
5904 random number depends on how it is used.

5905 **B.3.14.9** **Passwords**

5906 A password is used to acquire access to privileges by an entity, to derive keys or to detect the  
5907 re-use of passwords.

5908 If the password is only used to acquire access to privileges, and can be replaced in a timely  
5909 fashion, then the password need not be backed up. In this case, a password **shall not** be  
5910 archived.

5911 If the password is used to derive cryptographic keys or to prevent the re-use of passwords, the  
5912 password **should** be backed up and archived.

5913 **B.3.14.10** **Audit Information**

5914 Audit information containing key management events **shall** be backed up and archived.

5915 **B.4** **Key Recovery Systems**

5916 Key recovery is a broad term that may be applied to several different key recovery techniques.  
5917 Each technique will result in the recovery of a cryptographic key and other information  
5918 associated with that key (e.g., the key's metadata). The information required to recover that key  
5919 may be different for each application or each key\_recovery technique. The term "Key Recovery  
5920 Information" (KRI) is used below to refer to the aggregate of information that is needed to  
5921 recover or verify cryptographically protected information. Information that may be considered

Deleted: i.  
Deleted: keying material

5929 as KRI includes the keying material to be recovered or sufficient information to reconstruct the  
5930 keying material, other associated cryptographic information, the time when the key was  
5931 created, the identifier associated with the owner of the key (i.e., the individual, application or  
5932 organization that created the key or that owns the data protected by that key) and any  
5933 conditions that must be met by a requestor to be able to recover the keying material.

Deleted: of

5934 When an organization determines that key recovery is required for all or part of its keying  
5935 material, a secure Key Recovery System (KRS) needs to be established in accordance with a  
5936 well-defined Key Recovery Policy (see Appendix B.5). The KRS **shall** support the Key  
5937 Recovery Policy and consists of the techniques and facilities for saving and recovering the  
5938 keying material, the procedures for administering the system, and the personnel associated with  
5939 the system.

Deleted: Appendix B.5).

5940 When key recovery is determined to be necessary, the KRI may be stored either within an  
5941 organization (in backup or archive storage) or may be stored at a remote site by a trusted entity.  
5942 There are many acceptable methods for enabling key recovery. A KRS could be established  
5943 using a safe for keying material storage; a KRS might use a single computer that provides the  
5944 initial protection of the plaintext information, storage of the associated keying material and  
5945 recovery of that keying material; a KRS may include a network of computers with a central  
5946 Key Recovery Center; or a KRS could be designed using other configurations. Since a KRS  
5947 provides an alternative means for recovering cryptographic keys, a risk assessment **should**  
5948 be performed to ensure that the KRS adequately protects the organization's information and  
5949 reliably provides the KRI when required. It is the responsibility of the organization that needs  
5950 to provide key recovery to ensure that the Key Recovery Policy, the key recovery  
5951 methodology, and the Key Recovery System adequately protect the KRI.

5952 A KRS used by the Federal government **shall**:

- 5953 1. Generate or provide sufficient KRI to allow recovery or verification of protected  
5954 information when such information has been stored;
- 5955 2. Ensure the validity of the saved key and the other KRI;
- 5956 3. Ensure that the KRI is stored with persistence and availability that is commensurate  
5957 with that of the corresponding cryptographically protected data;
- 5958 4. Use cryptographic modules that are compliant with [FIPS140];
- 5959 5. Use **approved** algorithms, when cryptography is used;
- 5960 6. Use algorithms and key lengths that provide security strengths commensurate with the  
5961 sensitivity of the information associated with the KRI;
- 5962 7. Be designed to enforce the Key Recovery Policy (see Appendix B.5);
- 5963 8. Protect KRI against unauthorized disclosure or destruction; the KRS **shall** verify the  
5964 source of requests and ensure that only requested and authorized information is  
5965 provided to the requestor;
- 5966 9. Protect the KRI from modification;
- 5967 10. Have the capability of providing an audit trail; the audit trail **shall not** contain the keys  
5968 that are recovered or any passwords that may be used by the system; the audit trail  
5969 **should** include the identification of the event being audited, the time of the event, the

5989 **B.5 Key Recovery Policy**

5990 For each system, application and cryptographic technique used, consideration **shall** be given as  
 5991 to whether or not the keying material may need to be saved for later recovery to allow  
 5992 subsequent decryption or checking the information protected by the keying material. An  
 5993 organization that determines that key recovery is required for some or all of its keying material  
 5994 **should** develop a Key Recovery Policy that addresses the protection and continued  
 5995 accessibility of that information<sup>64</sup> (see IDOD-KRPI). The policy **should** answer the following  
 5996 questions (at a minimum):

Deleted: [DOD-KRPI].

- 5997 1. What keying material needs to be saved for a given application? For example, keys and  
 5998 IVs used for the decryption of stored information may need to be saved. Keys for the  
 5999 authentication of stored or transmitted information may also need to be saved.
- 6000 2. How and where will the keying material be saved? For example, the keying material  
 6001 could be stored in a safe by the individual who initiates the protection of the  
 6002 information (e.g., the encrypted information), or the keying material could be saved  
 6003 automatically when the protected information is transmitted, received or stored. The  
 6004 keying material could be saved locally or at some remote site.
- 6005 3. Who will be responsible for protecting the KRI? For example, each individual,  
 6006 organization or sub-organization could be responsible for their own keying material, or  
 6007 an external organization could perform this function.
- 6008 4. Who is authorized to receive the KRI upon request, and under what conditions? For  
 6009 example, the individual who protected the information (i.e., used and stored the KRI) or  
 6010 the organization to which the individual is assigned could recover the keying material.  
 6011 Legal requirements may need to be considered. An organization could request the  
 6012 information when the individual who stored the KRI is not available.
- 6013 5. Under what conditions can the policy be modified and by whom?
- 6014 6. What audit capabilities and procedures will be included in the KRS? The policy **shall**  
 6015 identify the events to be audited. Auditable events might include KRI requests and their  
 6016 associated responses; who made a request and when; the startup and shutdown of audit  
 6017 functions; the operations performed to read, modify or destroy the audit data; requests  
 6018 to access user authentication data; and the uses of authentication mechanisms.
- 6019 7. How will the KRS deal with aged keying material, whose security strength is now  
 6020 reduced beyond an acceptable level?
- 6021 8. Who will be notified when keying material is recovered and under what conditions? For  
 6022 example, the individual who encrypted data and stored the KRI could be notified when

Deleted: can

Deleted: key recovery

<sup>64</sup> An organization's key recovery policy may be included in its PKI Certificate Policy.

September 2015

- 6031 the organization recovers the decryption key because the person is absent, but the  
6032 individual might not be notified when the organization is monitoring the activities of  
6033 that individual.
- 6034 9. What procedures need to be followed when the KRS or some portion of the data within  
6035 the KRS is compromised?  
6036

6172 **APPENDIX D: Revisions**

6173 The original version of this document was published in August 2005. In May 2006, the  
6174 following revisions were incorporated:

- 6175 1. The definition of security strength has been revised to remove “or security level”  
6176 from the first column, since this term is not used in the document.
- 6177 2. In the footnote for 2TDEA in Table 2 of Section 5.6.1, the word “guarantee” has  
6178 been changed to “assessment”.
- 6179 3. In the paragraph under Table 2 in Section 5.6.1: The change originally identified  
6180 for the 2006 revision has been superseded by the 2011 revision discussed below.
- 6181 4. In Table 3 of Section 5.6.1, a list of appropriate hash functions have been inserted  
6182 into the HMAC and Key Derivation Function columns. In addition, a footnote has  
6183 been included for the Key Derivation Function column.
- 6184 5. The original text for the paragraph immediately below Table 3 has been removed.

6185 In March 2007, the following revisions were made to allow the dual use of keys during  
6186 certificate requests:

- 6187 1. In Section 5.2, the following text was added:  
6188 “This Recommendation also permits the use of a private key-transport or key-  
6189 agreement private key to generate a digital signature for the following special  
6190 case:  
6191 When requesting the (initial) certificate for a static key-establishment key,  
6192 the associated private key may be used to sign the certificate request. Also  
6193 refer to Section 8.1.5.1.1.2.”
- 6194 2. In Section 8.1.5.1.1.2, the fourth paragraph was originally as follows:  
6195 “The owner provides POP by performing operations with the private key that  
6196 satisfy the indicated key use. For example, if a key pair is intended to support  
6197 key transport, the owner may decrypt a key provided to the owner by the CA  
6198 that is encrypted using the owner's public key. If the owner can correctly  
6199 decrypt the ciphertext key using the associated private key and then provide  
6200 evidence that the key was correctly decrypted (e.g., by encrypting a random  
6201 challenge from the CA, then the owner has established POP. Where a key pair  
6202 is intended to support key establishment, POP **shall not** be afforded by  
6203 generating and verifying a digital signature with the key pair.”
- 6204 The paragraph was changed to the following, where the changed text is indicated  
6205 in italics:  
6206 “The (*reputed*) owner *should* provide POP by performing operations with the  
6207 private key that satisfy the indicated key use. For example, if a key pair is  
6208 intended to support *RSA* key transport, the *CA may provide the owner with a*  
6209 *key* that is encrypted using the owner's public key. If the owner can correctly  
6210 decrypt the ciphertext key using the associated private key and then provide  
6211 evidence that the key was correctly decrypted (e.g., by encrypting a random

6212 challenge from the CA, then the owner has established POP. *However, when a*  
6213 *key pair is intended to support key establishment, POP may also be afforded*  
6214 *by using the private key to digitally sign the certificate request (although this*  
6215 *is not the preferred method). The private key establishment private key (i.e.,*  
6216 *the private key-agreement or key-transport key) **shall not** be used to perform*  
6217 *signature operations after certificate issuance.”*

6218 In September 2011, several editorial corrections and clarifications were made, and the  
6219 following revisions were also made:

- 6220 1. The Authority section has been updated.
- 6221
- 6222 2. Section 1.2: The description of SP800-57, Part 3 has been modified per that  
6223 document.
- 6224
- 6225 3. Section 2.1: Definitions for key-derivation function, key-derivation key, key  
6226 length, key size, random bit generator and user were added. Definitions for  
6227 archive, key management archive, key recovery, label, owner, private key, proof  
6228 of possession, public key, security life of data, seed, shared secret and **should**  
6229 have been modified. The definition for cryptomodule was removed.
- 6230
- 6231 4. Section 2.2: The RBG acronym was inserted.
- 6232
- 6233 5. References to FIPS 180-3, FIPS 186-3, SP 800-38, SP 800-56A, SP 800-56B, SP  
6234 800-56C, SP 800-89, SP 800-90, SP 800-107, SP 800-108, SP 800-131A, SP 800-  
6235 132 and SP 800-133 have been corrected or inserted.
- 6236
- 6237 6. Section 4.2.4: A footnote was added about the two general types of digital  
6238 signatures and the focus for this Recommendation.
- 6239
- 6240 7. Sections 4.2.5, 4.2.5.3, 4.2.5.5 and 5.3: Discussions about SP 800-56B have been  
6241 included.
- 6242
- 6243 8. Section 5.1.1: The definitions of private signature key, public signature-  
6244 verification key, symmetric authentication key, private authentication key and  
6245 public authentication key have been corrected to reflect their current use in  
6246 systems and protocols. This change is reflected throughout the document.
- 6247
- 6248 9. Section 5.1.2, item 3: The description of shared secret has been modified to state  
6249 that shared secrets are to be protected and handled as if they are cryptographic  
6250 keys.
- 6251
- 6252 10. Sections 5.1.2, 5.3.7, 6.1.2 (Table 5), 8.1.5.3.4, 8.1.5.3.5, 8.2.2.1 (Table 7) and  
6253 8.3.1 (Table 9): “Other secret information” has been added to the list of other  
6254 cryptographic or related information.
- 6255
- 6256 11. Section 5.3.1: An additional risk factor was inserted about personnel turnover.
- 6257

- 6258 12. Section 5.3.4: A statement was inserted to clarify the difference between the  
6259 cryptoperiod of a public key and the validity period of a certificate.  
6260
- 6261 13. Section 5.3.6: Statements were inserted that emphasize that longer or shorter  
6262 cryptoperiods than those suggested may be warranted. Also, further discussion  
6263 was added about the cryptoperiod of the public ephemeral key-agreement key.  
6264
- 6265 14. Section 5.4.4: A discussion of an owner’s assurance of private-key possession  
6266 was added.  
6267
- 6268 15. Section 5.5: Statements were added about the compromise of a CA’s private  
6269 signature key, and advice was provided for handling such an event.  
6270
- 6271 16. Section 5.6.1: Table 3 and the text preceding the table have been revised for  
6272 clarity. Additional footnotes were inserted related to table entries, and the  
6273 footnote about the security strength provided by SHA-1 was modified to indicate  
6274 that its security strength for digital signature applications remains the subject of  
6275 speculation.  
6276
- 6277 17. Sections 5.6.2 – 5.6.4: Table 4 and the text preceding it have been modified to be  
6278 consistent with SP 800-131A. Also, the examples have been modified.  
6279
- 6280 18. Section 5.6.5: This new section was added to address the implications associated  
6281 with the reduction of security strength because of improvements in computational  
6282 capabilities or cryptanalysis.  
6283
- 6284 19. Sections 7, 7.1, 7.2 and 7.3: The description of the states and their transitions have  
6285 been reworded to require specific behavior (e.g., using **shall** or **shall not**  
6286 statements, rather than containing statement of fact (e.g., using “is” or are”).  
6287
- 6288 20. Section 7.3: A discussion of the transition of a private key-transport key and an  
6289 ephemeral private key-agreement key were added. The previous discussion on  
6290 private and public key-agreement keys was changed to discuss static private and  
6291 public key-agreement keys and ephemeral public key-agreement keys.
- 6292 21. Section 8.1.5.3.4: This section was revised to be more consistent with SP 800-  
6293 90A.  
6294
- 6295 22. Sections 8.1.5.3.7 and 8.1.5.3.8: New sections were inserted to discuss the  
6296 distribution of random numbers and passwords.  
6297
- 6298 23. Section 8.1.6: Text was inserted to indicate which keys would or would not be  
6299 registered.  
6300
- 6301 24. Section 8.2.4: This section was revised to be consistent with SP 800-56A SP 800-  
6302 56B, SP 800-56C, SP 800-108 and SP 800-132.  
6303

- 6304 25. Section 8.3.1, Table 9: The table was modified to indicate that it is OK to archive  
6305 the static key-agreement key.  
6306
- 6307 26. Changes were made to Sections 8.3.1; 9.3.2; and Appendices B, B.1, B.3, B.3.1.2,  
6308 B.3.2, B.3.4, B.3.5, and B.3.10.2 to remove the impression that archiving is only  
6309 performed after the end of the cryptoperiod of a key (e.g., keys could be archived  
6310 immediately upon activation), and that the keys in an archive are only of historical  
6311 interest (e.g., they may be needed to decrypt data long after the cryptoperiod of a  
6312 key).
- 6313 27. Section 8.3.3: The discussion about de-registering compromised and non-  
6314 compromised keys was modified.  
6315
- 6316 28. Section 8.3.5: A discussion about how revocation is achieved for a PKI and for  
6317 symmetric-key systems was added.  
6318
- 6319 29. Appendix B.14.9 was revised to be consistent with SP 800-132.  
6320
- 6321 30. The tags for references to FIPS were modified to remove the version number. The  
6322 version number is provided in Appendix C.  
6323

6324 [In 2015, several editorial corrections and clarifications were made, and the following](#)  
6325 [revisions were also made:](#)

- 6326 [1. Changed the reference to SP 800-21 to SP 800-175.](#)
- 6327 [2. Corrected web site links.](#)

6389 [have been removed, since this is discussed in SP 800-89. A note was added that](#)  
6390 [this assurance could be obtained by a CA.](#)
- 6391 [28. Section 5.5: Unnecessary text has been removed.](#)
- 6392 [29. Section 5.6.1: The security-strength discussion has been revised, and a reference](#)  
6393 [to SP 800-158 has been inserted.](#)
- 6394 [Deleted a note about the block size that was unnecessary.](#)
- 6395 [Table 2 has been revised to provide a visual indication of which key sizes are no](#)  
6396 [longer approved for applying cryptographic protection, which are approved, and](#)  
6397 [which are approved, but not specifically mentioned in the FIPS standards. The](#)  
6398 [note about SHA-1 was modified.](#)
- 6399 [Table 3 and the following text have been revised to clearly indicate that SHA-1 is](#)  
6400 [no longer approved for generating digital signatures. The SHA-3 hash functions](#)  
6401 [are now included in the table. A note has been added to the header for HMAC.](#)
- 6402 [30. Section 5.6.2: Table 4 has been updated to indicate the currently projected](#)  
6403 [security strength time frames.](#)
- 6404 [31. Section 5.6.3: A reference to SP 800-158 has been inserted for discussions about](#)  
6405 [determining the actual security strength of a key, based on how it was generated](#)  
6406 [and subsequently handled.](#)
- 6407 [32. Section 6.1: Changes have been made to the integrity and confidentiality](#)  
6408 [protection topics to be consistent with \[SP 800-152\]. For the integrity protection](#)  
6409 [topic, " integrity protection can be provided by cryptographic integrity](#)  
6410 [mechanisms..." has been changed to " integrity protection \*\*shall\*\* be provided by](#)  
6411 [cryptographic integrity mechanisms..."](#)
- 6412 [33. Section 6.2: An "in use" state has been introduced, along with an](#)  
6413 [acknowledgement that the key may also be in transit and/or in storage.](#)
- 6414 [34. Section 6.2.1.3: additional guidance has been added about the generation of the](#)  
6415 [key components.](#)
- 6416 [36. Section 6.2.2.3: Addition text was inserted to address the \[FIPS 140-2\] security](#)  
6417 [level in accordance with \[SP 800-152\].](#)
- 6418 [37. Section 6.2.3.1: A key's history has been inserted as a possible metadata item. A](#)  
6419 [reference to SP 800-158 has been included to provide guidance on handling](#)  
6420 [metadata.](#)

- 6421 [38. Section 7 has been completely rewritten, including adding a suspended state and](#)
- 6422 [providing clarity on the transitions of the different key types. A suspended state](#)
- 6423 [has been added to Figure 3 and the discussion.](#)
- 6424 [39. Section 8: The suspended state has been added to the discussions and included in](#)
- 6425 [Figure 5.](#)
- 6426 [40. Section 8.1.5: A reference to SP 800-133 has been included.](#)
- 6427 [41. Section 8.1.5.1: A sentence has been added to the end of paragraph 2 about](#)
- 6428 [distributing keying material to an organization's sub-entities.](#)
- 6429 [42. Section 8.1.5.1.1.1: The section has been revised to clearly and more correctly](#)
- 6430 [describe what a trust anchor is \(i.e., a CA, not a certificate for that CA\).](#)
- 6431 [43. Section 8.1.5.1.2: A reference to SP 800-56B has been removed, since it does not](#)
- 6432 [include schemes that use ephemeral keys.](#)
- 6433 [44. Section 8.1.5.2, 8.1.5.2.2, and 8.2.3.2: References to the use of key update as an](#)
- 6434 [approved method for key change have been removed or modified.](#)
- 6435 [45. Section 8.1.5.2.2.2: References to SP 800-38F, SP 800-56A and SP 800-56B have](#)
- 6436 [been added. A note has been added to mention authenticated encryption modes.](#)
- 6437 [46. Section 8.1.5.2.3: Mentions of key wrapping have been removed, since it is not](#)
- 6438 [used in key-agreement schemes.](#)
- 6439 [47. Section 8.1.5.3.4 has been rewritten.](#)
- 6440 [48. Sections 8.2.1.1 and 8.2.1.2 : The mention of a "device" has been removed, as the](#)
- 6441 [appropriate reference is to cryptographic modules.](#)
- 6442 [49. Section 8.2.3.2: Key update is now disallowed, as stated in SP 800-152.](#)
- 6443 [50. Section 8.3.1: More guidance has been provided on using archives.](#)
- 6444 [51. Section 8.3.4: The text was modified to discuss the destruction of a key, rather](#)
- 6445 [than the destruction of the media containing a destroyed key.](#)
- 6446 [52. Section 8.3.5, paragraph 6: "...the corresponding public-key certificate \*\*should\*\* be](#)
- 6447 [revoked " has been changed to "...the corresponding public-key certificate \*\*shall\*\*](#)
- 6448 [be revoked as soon as possible," and more guidance has been provided about](#)
- 6449 [using revoked certificates.](#)
