Authority

70 This publication has been developed by NIST to further its statutory responsibilities under the Federal
71 Information Security Management Act (FISMA), Public Law (P.L.) 107-347. NIST is responsible for
72 developing information security standards and guidelines, including minimum requirements for Federal
73 information systems, but such standards and guidelines shall not apply to national security systems
74 without the express approval of appropriate Federal officials exercising policy authority over such
75 systems. This guideline is consistent with the requirements of the Office of Management and Budget
76 (OMB) Circular A-130, Section 8b(3), *Securing Agency Information Systems*, as analyzed in Circular A-
77 130, Appendix IV: *Analysis of Key Sections*. Supplemental information is provided in Circular A-130,
78 Appendix III, *Security of Federal Automated Information Resources*.

79 Nothing in this publication should be taken to contradict the standards and guidelines made mandatory
80 and binding on Federal agencies by the Secretary of Commerce under statutory authority. Nor should
81 these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of
82 Commerce, Director of the OMB, or any other Federal official. This publication may be used by
83 nongovernmental organizations on a voluntary basis and is not subject to copyright in the United States.
84 Attribution would, however, be appreciated by NIST.

90 Certain commercial entities, equipment, or materials may be identified in this document in order to
91 describe an experimental procedure or concept adequately. Such identification is not intended to imply
92 recommendation or endorsement by NIST, nor is it intended to imply that the entities, materials, or
93 equipment are necessarily the best available for the purpose.

94
95 There may be references in this publication to other publications currently under development by NIST
96 in accordance with its assigned statutory responsibilities. The information in this publication, including
97 concepts and methodologies, may be used by Federal agencies even before the completion of such
98 companion publications. Thus, until each publication is completed, current requirements, guidelines,
99 and procedures, where they exist, remain operative. For planning and transition purposes, Federal
100 agencies may wish to closely follow the development of these new publications by NIST.

101 Organizations are encouraged to review all draft publications during public comment periods and
102 provide feedback to NIST. All NIST Computer Security Division publications, other than the ones
103 noted above, are available at <http://csrc.nist.gov/publications>.

Reports on Computer Systems Technology

111 The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology
112 (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's
113 measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of
114 concept implementations, and technical analyses to advance the development and productive use of
115 information technology. ITL's responsibilities include the development of management, administrative,
116 technical, and physical standards and guidelines for the cost-effective security and privacy of other than
117 national security-related information in Federal information systems. The Special Publication 800-series
118 reports on ITL's research, guidelines, and outreach efforts in information system security, and its
119 collaborative activities with industry, government, and academic organizations.

120
121
122

Abstract

123 FIPS 201 defines the requirements and characteristics of a government-wide interoperable identity
124 credential. FIPS 201 also specifies that this identity credential must be stored on a smart card. This
125 document, SP 800-73, contains the technical specifications to interface with the smart card to retrieve and
126 use the PIV identity credentials. The specifications reflect the design goals of interoperability and PIV
127 Card functions. The goals are addressed by specifying a PIV data model, card edge interface, and
128 application programming interface. Moreover, this document enumerates requirements where the
129 international integrated circuit card standards [ISO7816] include options and branches. The
130 specifications go further by constraining implementers' interpretations of the normative standards. Such
131 restrictions are designed to ease implementation, facilitate interoperability, and ensure performance, in a
132 manner tailored for PIV applications.

133
134

184

185 **1. Introduction**

186 Homeland Security Presidential Directive-12 (HSPD-12) called for a common identification standard to
187 be adopted governing the interoperable use of identity credentials to allow physical and logical access to
188 Federally controlled facilities and information systems. Personal Identity Verification (PIV) of Federal
189 Employees and Contractors, Federal Information Processing Standard 201 (FIPS 201) [FIPS201] was
190 developed to establish standards for identity credentials. Special Publication 800-73-4 (SP 800-73-4)
191 contains technical specifications to interface with the smart card (PIV Card¹) to retrieve and use the
192 identity credentials.

193 **1.1 Purpose**

194 FIPS 201 defines procedures for the PIV lifecycle activities including identity proofing, registration, PIV
195 Card issuance, and PIV Card usage. FIPS 201 also specifies that the identity credentials must be stored
196 on a smart card. SP 800-73-4 contains the technical specifications to interface with the smart card to
197 retrieve and use the identity credentials. The specifications reflect the design goals of interoperability and
198 PIV Card functions. The goals are addressed by specifying a PIV data model, card edge interface, and
199 application programming interface (API). Moreover, SP 800-73-4 enumerates requirements where the
200 international integrated circuit card (ICC) standards [ISO7816] include options and branches. The
201 specifications go further by constraining implementers' interpretations of the normative standards. Such
202 restrictions are designed to ease implementation, facilitate interoperability, and ensure performance in a
203 manner tailored for PIV applications.

204 **1.2 Scope**

205 SP 800-73-4 specifies the PIV data model, application programming interface (API), and card interface
206 requirements necessary to comply with the use cases, as defined in Section 6 of FIPS 201 and further
207 described in Appendix B of SP 800-73-4 Part 1. Interoperability is defined as the use of PIV identity
208 credentials such that client-application programs, compliant card applications, and compliant ICCs can be
209 used interchangeably by all information processing systems across Federal agencies. SP 800-73-4 defines
210 the PIV data elements' identifiers, structure, and format. SP 800-73-4 also describes the client API and
211 card command interface for use with the PIV Card.

212 This part, SP 800-73-4 Part 3: *PIV Client Application Programming Interface*, contains technical
213 specifications of the PIV client application programming interface to the PIV Card.

214 **1.3 Audience and Assumptions**

215 This document is targeted at Federal agencies and implementers of PIV systems. Readers are assumed to
216 have a working knowledge of smart card standards and applications.

217 Readers should also be aware of SP 800-73-4 Part 1, Section I, which details the revision history of
218 SP800-73, Section II, which contains configuration management recommendations, and Section III,
219 which specifies NPVP conformance testing procedures.

¹ A physical artifact (e.g., identity card, "smart" card) issued to an individual that contains a PIV Card Application which stores identity credentials (e.g., photograph, cryptographic keys, digitized fingerprint representation) so that the claimed identity of the cardholder can be verified against the stored credentials by another person (human readable and verifiable) or an automated process (computer readable and verifiable).

220 **1.4 Content and Organization**

221 All sections in this document are *normative* (i.e., mandatory for compliance) unless specified as
222 *informative* (i.e., non-mandatory). Following is the structure of Part 3:

- 223 + Section 1, *Introduction*, provides the purpose, scope, audience and assumptions of the document
224 and outlines its structure.
- 225 + Section 2, *Overview: Concepts and Constructs*, describes both the PIV Card Application and the
226 PIV client API. This section is *informative*.
- 227 + Section 3, *Client Application Programming Interface*, describes the set of entry points accessible
228 by client applications through the PIV Middleware to interact with the PIV Card.
- 229 + Appendix A, *Terms, Acronyms, and Notation*, contains the list of terms and acronyms used in this
230 document and explains the notation in use. This section is *informative*.
- 231 + Appendix B, *References*, contains the list of documents used as references by this document.
232 This section is *informative*.

2. Overview: Concepts and Constructs

234 SP 800-73-4 Parts 2 and 3 define two interfaces to an ICC that contains the PIV Card Application: a low-
235 level card command interface (Part 2) and a high-level client API (Part 3).

236 The information processing concepts and data constructs on both interfaces are identical and may be
237 referred to generically as the information processing concepts and data constructs on the *PIV interfaces*
238 without specific reference to the client API or the card command interface.

239 The client API provides task-specific programmatic access to these concepts and constructs and the card
240 command interface provides communication access to concepts and constructs. The client API is used by
241 client applications using the PIV Card Application. The card command interface is used by software
242 implementing the client API (middleware).

243 The client API is thought of as being at a higher level than the card command interface because access to
244 a single entry point on the client API may cause multiple card commands to traverse the card command
245 interface. In other words, it may require more than one card command on the card command interface to
246 accomplish the task represented by a single call on an entry point of the client API.

247 The client API is a program execution, call/return style interface, whereas the card command interface is a
248 communication protocol, command/response style interface. Because of this difference, the
249 representation of the PIV concepts and constructs as bits and bytes on the client API may be different
250 from the representation of these same concepts and constructs on the card command interface.

251

252

253 **3. Client Application Programming Interface**

254 Table 1 lists the entry points on the PIV client API. This section references object identifiers (OIDs),
255 which are defined and can be found in Part 1 (Table 3).

256 **Table 1. Entry Points on PIV Client Application Programming Interface**

Type	Name
Entry Points for Communication	pivMiddlewareVersion
	pivConnect
	pivDisconnect
Entry Points for Data Access	pivSelectCardApplication
	pivEstablishSecureMessaging
	pivLogIntoCardApplication
	pivGetData
	pivLogoutOfCardApplication
Entry Points for Cryptographic Operations	pivCrypt
Entry Points for Credential Initialization and Administration	pivPutData
	pivGenerateKeyPair

257
258 If both the PIV Middleware and the PIV Card support secure messaging then all non-card-management
259 functionality² of the PIV Card may be accessed over either the contact or contactless interface of the card.
260 In order to perform non-card-management functionality that would otherwise be limited to the contact
261 interface, the client application must first establish a virtual contact interface by calling the
262 **pivEstablishSecureMessaging** function and then using the **pivLogIntoCardApplication** function to submit
263 the pairing code to the card. If the client application does not have another means of determining whether
264 communication with the PIV Card is over a contact or contactless interface, it may determine this by
265 using the **pivGetData** function to attempt to read a mandatory data object, such as the X.509 Certificate
266 for PIV Authentication or the Security Object, that has an access rule for read of “Always,” but that is
267 only accessible over the contact and virtual contact interfaces (see Part 1, Table 2). If the return code
268 from **pivGetData** is **PIV_SECURITY_CONDITIONS_NOT_SATISFIED** this indicates that communication
269 with the card is over a contactless interface.

² Only the **pivPutData** and **pivGenerateKeyPair** API functions perform card-management functionality.

270 **3.1 Entry Points for Communication**271 **3.1.1 pivMiddlewareVersion**272 **Purpose:** Returns the PIV Middleware version string

273 **Prototype:** `status_word pivMiddlewareVersion(`
 274 `OUT version versionString`
 275 `);`

276 **Parameter:** **versionString**

- 277 + For SP 800-73-4 Part 3 conformant PIV Middleware, the parameter returns
- 278 "800-73-4 Client API" or "800-73-4 Client API with SM".
- 279 + For SP 800-73-3 Part 3 conformant PIV Middleware, the parameter returns
- 280 "800-73-3 Client API".
- 281 + For SP 800-73-2 Part 3 conformant PIV Middleware, the parameter returns
- 282 "800-73-2 Client API".
- 283 + For SP 800-73-1 conformant PIV Middleware, the pivMiddlewareVersion client
- 284 API function is not supported. Therefore, a client application invoking the
- 285 pivMiddlewareVersion function should expect a "function-not-supported" error
- 286 from a SP 800-73-1 conformant PIV Middleware. For purposes of version
- 287 determination, failure to obtain a specific version from pivMiddlewareVersion
- 288 shall be considered equivalent to obtaining a response of "800-73-1 Client API".

289 **Return Codes:** PIV_OK

290 PIV Middleware that returns a versionString of "800-73-4 Client API with SM" shall implement all PIV
 291 Middleware functions listed in Table 1 and be able to recognize and process all mandatory and optional
 292 PIV data objects. PIV Middleware that returns a versionString of "800-73-4 Client API" shall implement
 293 all PIV Middleware functions listed in Table 1 except pivEstablishSecureMessaging and shall be able to
 294 recognize and process all mandatory and optional PIV data objects.

295 Note: Only SP 800-73-4 based PIV Middleware supports the use of on-card biometric comparison (OCC)
 296 data and the pairing code with the pivLogIntoCardApplication function, and only PIV Middleware that
 297 returns a versionString of "800-73-4 Client API with SM" supports the use of secure messaging (SM) and
 298 the virtual contact interface, which have been introduced in Parts 1 and 2 of SP 800-73-4. SP 800-73-1,
 299 SP 800-73-2, and SP 800-73-3 based PIV Middleware remain valid implementations; however, agencies
 300 are cautioned that using these implementations may result in limited interoperability. Further information
 301 can be found in Part 1 of SP 800-73-4. It provides an SP 800-73 revision history (Section I) and
 302 recommendations for PIV Middleware configuration management (Section II).

303 **3.1.2 pivConnect**304 **Purpose:** Connects the client API to the PIV Card Application on a specific ICC.

305 **Prototype:** `status_word pivConnect(`
 306 `IN Boolean sharedConnection,`
 307 `INOUT sequence of bytes connectionDescription,`
 308 `INOUT LONG CDLength,`
 309 `OUT handle cardHandle`
 310 `);`

311 **Parameters:** **sharedConnection** If TRUE other client applications can establish
 312 concurrent connections to the ICC. If FALSE and the
 313 connection is established then the calling client
 314 application has exclusive access to the ICC.

315 **connectionDescription** A connection description data object (tag 0x7F21).
 316 See Table 2.

317 If the length of the value field of the '8x' data object in
 318 the connection description data object is zero then a
 319 list of the card readers of the type indicated by the tag
 320 of the '8x' series data object and available at the '9x'
 321 location is returned in the connectionDescription.

322 In order to provide sufficient space for the return
 323 value, the client application shall allocate a buffer of at
 324 least 2048 bytes for connectionDescription.

325 The connection description BER-TLV [ISO8825] used
 326 on the PIV client API shall have the structure
 327 described in Table 2.

328 **Table 2. Data Objects in a Connection Description Template (Tag 0x7F21)**

Description	Tag	Comment
Interface device – PC/SC	'81'	Card reader name
Interface device – SCP	'82'	Card reader identifier on terminal equipment
Interface device – EMR	'83'	Contactless connection using radio transmission
Interface device – IR	'84'	Contactless connection using infrared transmission
Interface device – PKCS#11	'85'	PKCS#11 interface
Interface device – CryptoAPI	'86'	CryptoAPI interface
Network node – Local	'90'	No network between client application host and card reader host
Network node – IP	'91'	IP address of card reader host
Network node – DNS	'92'	Internet domain name of card reader host
Network node – ISDN	'93'	ISDN dialing number string of terminal equipment containing the card reader

329
 330 At most one selection from the '8x' series and one selection from the '9x' series shall appear in the
 331 connection description template.

332 For example, '7F 21 0C 82 04 41 63 6D 65 91 04 C0 00 02 17' describes a connection to a generic card
 333 reader at Internet address 192.0.2.23. As another example, '7F 21 0B 82 01 00 93 06 16 17 55 50 12 3F'
 334 describes a connection to the subscriber identity module in the mobile phone at +1 617 555 0123.

335 When used as an argument to the pivConnect entry point on the PIV client API described in this section,
 336 an '8x' series data object with zero length together with a '9x' series data object requests the return of all

337 available card readers of the described type on the described node. Thus, '7F 21 04 81 00 90 00' would
338 request a list of all available PC/SC card readers on the host on which the client application was running.

339 **CDLength** Length of the card description parameter.

340 **cardHandle** The returned opaque identifier of a communication
341 channel to a particular ICC and hence of the card itself.
342 cardHandle is used in all other entry points on the PIV
343 client API to identify to which card the functionality of
344 the entry point is to be applied.

345 **Return Codes:** PIV_OK
346 PIV_CONNECTION_DESCRIPTION_MALFORMED
347 PIV_CONNECTION_FAILURE
348 PIV_CONNECTION_LOCKED

349 3.1.3 pivDisconnect

350 **Purpose:** Disconnect the PIV API from the PIV Card Application and the ICC containing the
351 PIV Card Application.

352 **Prototype:** status_word pivDisconnect(
353 IN handle **cardHandle**
354);

355 **Parameters:** **cardHandle** Opaque identifier of the card to be acted upon as
356 returned by pivConnect. The value of cardHandle is
357 undefined upon return from pivDisconnect.

358 **Return Codes:** PIV_OK
359 PIV_INVALID_CARD_HANDLE
360 PIV_CARD_READER_ERROR

361 If secure messaging has been established then the PIV Middleware shall zeroize the secure messaging
362 session keys.

363 3.2 Entry Points for Data Access

364 3.2.1 pivSelectCardApplication

365 **Purpose:** Set the PIV Card Application as the currently selected card application and establish
366 the PIV Card Application's security state.

367 **Prototype:** status_word pivSelectCardApplication(
368 IN handle **cardHandle**,
369 IN sequence of byte **applicationAID**,
370 IN LONG **aidLength**,
371 OUT sequence of byte **applicationProperties**,
372 INOUT LONG **APLength**
373);

374 **Parameters:** **cardHandle** Opaque identifier of the card to be acted upon as
375 returned by pivConnect.

376	aidLength	Length of the PIV Card Application AID.
377	applicationAID	The AID of the PIV Card Application that is to become the currently selected card application.
378		
379	applicationProperties	The application properties of the selected PIV Card Application. See Part 2, Table 3.
380		
381	APLength	As an input, length of the buffer allocated for applicationProperties. As an output, length of the application properties.
382		
383		

384	Return Codes:	PIV_OK
385		PIV_INVALID_CARD_HANDLE
386		PIV_CARD_APPLICATION_NOT_FOUND
387		PIV_CARD_READER_ERROR
388		PIV_INSUFFICIENT_BUFFER

389 If the length of application properties is longer than the buffer allocated by the client application, then the
390 PIV Middleware shall return PIV_INSUFFICIENT_BUFFER, but shall still set APLength to the length of
391 the application properties.

392 3.2.2 pivEstablishSecureMessaging

393 **Purpose:** Establish secure messaging with the PIV Card Application.

394 **Prototype:** status_word pivEstablishSecureMessaging(
395 IN handle cardHandle,
396);

397 **Parameters:** cardHandle Opaque identifier of the card to be acted upon as
398 returned by pivConnect.

399 **Return Codes:** PIV_OK
400 PIV_INVALID_CARD_HANDLE
401 PIV_CARD_READER_ERROR
402 PIV_SM_FAILED

403 After successful execution of the key establishment protocol, the PIV Middleware shall perform all
404 subsequent GET DATA, VERIFY, and GENERAL AUTHENTICATE commands over secure
405 messaging, with the exception of any subsequent uses of the GENERAL AUTHENTICATE command to
406 perform the key establishment protocol.

407 3.2.3 pivLogIntoCardApplication

408 **Purpose:** Set security state within the PIV Card Application.

409 **Prototype:** status_word pivLogIntoCardApplication(
410 IN handle cardHandle,
411 IN sequence of byte authenticators,
412 IN LONG AuthLength
413);

451 **DataLength** As an input, length of the buffer allocated for data. As
452 an output, length of the data retrieved from the PIV
453 Card.

454 **Return Codes:** PIV_OK
455 PIV_INVALID_CARD_HANDLE
456 PIV_INVALID_OID
457 PIV_DATA_OBJECT_NOT_FOUND
458 PIV_SECURITY_CONDITIONS_NOT_SATISFIED
459 PIV_CARD_READER_ERROR
460 PIV_SM_FAILED
461 PIV_INSUFFICIENT_BUFFER

462 If the length of the retrieved data is longer than the buffer allocated by the client application, then the PIV
463 Middleware shall return PIV_INSUFFICIENT_BUFFER, but shall still set DataLength to the length of the
464 retrieved data.

465 3.2.5 pivLogoutOfCardApplication

466 **Purpose:** Reset the application security state/status of the PIV Card Application.

467 **Prototype:** status_word pivLogoutOfCardApplication(
468 IN handle cardHandle
469);

470 **Parameters:** **cardHandle** Opaque identifier of the card to be acted upon as
471 returned by pivConnect. The cardHandle remains valid
472 after execution of this function.

473 **Return Codes:** PIV_OK
474 PIV_INVALID_CARD_HANDLE
475 PIV_CARD_READER_ERROR

476 3.3 Entry Points for Cryptographic Operations

477 3.3.1 pivCrypt

478 **Purpose:** Perform a cryptographic operation³ such as encryption or signing on a sequence of
479 bytes. Part 1, Appendix C describes recommended procedures for PIV algorithm
480 identifier discovery.

481 **Prototype:** status_word pivCrypt(
482 IN handle cardHandle,
483 IN byte algorithmIdentifier,
484 IN byte keyReference,
485 IN sequence of byte algorithmInput,
486 IN LONG inputLength,
487 OUT sequence of byte algorithmOutput,
488 INOUT LONG outputLength
489);

³ The pivCrypt function does not perform any cryptographic operations itself. It provides the interface to the GENERAL AUTHENTICATE command to perform cryptographic operations on card. All cryptographic operations, except SM on the client side, are performed outside the PIV Middleware.

490	Parameters:	cardHandle	Opaque identifier of the card to be acted upon as
491			returned by pivConnect.
492		algorithmIdentifier	Identifier of the cryptographic algorithm to be used for
493			the cryptographic operation. [SP800-78, Tables 6-2 and
494			6-3]
495		keyReference	Identifier of the on-card key to be used for the
496			cryptographic operation. See [SP800-78, Table 6-1] and
497			Part 1, Table 4.
498		algorithmInput	Sequence of bytes used as the input to the cryptographic
499			operation. The algorithmInput for RSA algorithms shall
500			be restricted to the range 0 to $n-1$, where n is the RSA
501			modulus.
502		inputLength	Length of the algorithm input.
503		algorithmOutput	Sequence of bytes output by the cryptographic operation.
504		outputLength	As an input, length of the buffer allocated for
505			algorithmOutput. As an output, length of the algorithm
506			output.
507	Return Codes:	PIV_OK	
508		PIV_INVALID_CARD_HANDLE	
509		PIV_INVALID_KEYREF_OR_ALGORITHM	
510		PIV_SECURITY_CONDITIONS_NOT_SATISFIED	
511		PIV_INPUT_BYTES_MALFORMED	
512		PIV_CARD_READER_ERROR	
513		PIV_SM_FAILED	
514		PIV_INSUFFICIENT_BUFFER	

515 The PIV_INPUT_BYTES_MALFORMED error condition indicates that some property of the data to be
516 processed such as the length or padding was inappropriate for the requested cryptographic algorithm or
517 key.

518 If the value of keyReference is '03' (PIV Secure Messaging key) then the PIV Middleware shall return
519 PIV_INVALID_KEYREF_OR_ALGORITHM.

520 If the length of the algorithm output is longer than the buffer allocated by the client application, then the
521 PIV Middleware shall return PIV_INSUFFICIENT_BUFFER, but shall still set outputLength to the length
522 of the algorithm output.

523 3.4 Entry Points for Credential Initialization and Administration

524 The PIV Middleware shall not submit data provided to the pivPutData or pivGenerateKeyPair function
525 over the contactless interface. If the PIV Middleware is not communicating with the PIV Card via the
526 card's contact interface then the pivPutData or pivGenerateKeyPair function shall return
527 PIV_SECURITY_CONDITIONS_NOT_SATISFIED.

528 3.4.1 pivPutData

529 **Purpose:** Replace the entire data content of the named data object with the provided data.

530

586 **Appendix A—Terms, Acronyms, and Notation**587 **A.1 Terms**

588	Application Identifier	A globally unique identifier of a card application as defined in ISO/IEC 7816-4.
589		
590	Application Session	The period of time within a card session between when a card application is selected and a different card application is selected or the card session ends.
591		
592		
593	Algorithm Identifier	A PIV algorithm identifier is a one-byte identifier that specifies a cryptographic algorithm and key size. For symmetric cryptographic operations, the algorithm identifier also specifies a mode of operation (i.e., ECB).
594		
595		
596		
597	BER-TLV Data Object	A data object coded according to ISO/IEC 8825-2.
598	Card	An integrated circuit card.
599		
600	Card Application	A set of data objects and card commands that can be selected using an application identifier.
601		
602	Card Interface Device	An electronic device that connects an integrated circuit card and the card applications therein to a client application.
603		
604	Card Reader	Synonym for card interface device.
605	Client Application	A computer program running on a computer in communication with a card interface device.
606		
607	Card Management Operation	Any operation involving the PIV Card Application Administrator.
608		
609	Data Object	An item of information seen at the card command interface for which are specified a name, a description of logical content, a format and a coding.
610		
611	Interface Device	Synonym for card interface device.
612	Key Reference	A PIV key reference is a one-byte identifier that specifies a cryptographic key according to its PIV Key Type. The identifier used in cryptographic protocols such as an authentication or a signing protocol.
613		
614		
615	Object Identifier	A globally unique identifier of a data object as defined in ISO/IEC 8824-2.
616		
617	Reference Data	Cryptographic material used in the performance of a cryptographic protocol such as an authentication or a signing protocol. The reference data length is the maximum length of a password or PIN. For algorithms, the reference data length is the length of a key.
618		
619		
620		

621	Status Word	Two bytes returned by an integrated circuit card after processing any
622		command that encodes the success of or errors encountered during said
623		processing.
624	Template	A (constructed) BER-TLV data object whose value field contains
625		specific BER-TLV data objects.
626	A.2	Acronyms
627	AID	Application Identifier
628	API	Application Programming Interface
629	ASN.1	Abstract Syntax Notation One
630	BER	Basic Encoding Rules
631	FIPS	Federal Information Processing Standards
632	FISMA	Federal Information Security Management Act
633	GSC-IS	Government Smart Card Interoperability Specification
634	HSPD	Homeland Security Presidential Directive
635	ICC	Integrated Circuit Card
636	IEC	International Electrotechnical Commission
637	INCITS	InterNational Committee for Information Technology Standards
638	ISDN	Integrated Services Digital Network
639	ISO	International Organization for Standardization
640	ITL	Information Technology Laboratory
641	LSB	Least Significant Bit
642	MSB	Most Significant Bit
643	NIST	National Institute of Standards and Technology
644	OCC	On-Card biometric Comparison
645	OID	Object Identifier
646	OMB	Office of Management and Budget
647	PC/SC	Personal Computer/Smart Card
648	PIN	Personal Identification Number
649	PIV	Personal Identity Verification
650	PKCS	Public-Key Cryptography Standards
651	PKI	Public Key Infrastructure
652	RFU	Reserved for Future Use
653	SM	Secure Messaging
654	SP	Special Publication
655	TLV	Tag-Length-Value

656 **A.3 Notation**

657 The sixteen hexadecimal digits shall be denoted using the alphanumeric characters 0, 1, 2, ..., 9,
658 A, B, C, D, E, and F. A byte consists of two hexadecimal digits, for example, '2D'. The two
659 hexadecimal digits are represented in quotations '2D' or as 0x2D. A sequence of bytes may be
660 enclosed in single quotation marks, for example 'A0 00 00 01 16', rather than given as a sequence
661 of individual bytes, 'A0' '00' '00' '01' '16'.

662 A byte can also be represented by bits b8 to b1, where b8 is the most significant bit (MSB) and b1
663 is the least significant bit (LSB) of the byte. In textual or graphic representations, the leftmost bit
664 is the MSB. Thus, for example, the most significant bit, b8, of '80' is 1 and the least significant
665 bit, b1, is 0.

666 All bytes specified as RFU shall be set to '00' and all bits specified as RFU shall be set to 0.

667 All lengths shall be measured in number of bytes unless otherwise noted.

668 Data objects in templates are described as being mandatory (M) or optional (O). 'Mandatory'
669 means the data object shall appear in the template. 'Optional' means the data object may appear
670 in the template.

671 In other tables the M/O/C column identifies properties of the PIV Card Application that shall be
672 present (M), may be present (O), or are conditionally required to be present (C).

673 BER-TLV data object tags are represented as byte sequences as described above. Thus, for
674 example, 0x4F is the interindustry data object tag for an application identifier and 0x7F60 is the
675 interindustry data object tag for the biometric information template.
