Overview

This document is a FIPS 140-2 Security Policy for Fortinet's FortiGate-100E, 201E, 300D, 600D and FortiGate-800D Multi-Threat Security Systems. This policy describes how the FortiGate-100E, 201E, 300D, 600D and FortiGate-800D (hereafter referred to as the 'modules') meet the FIPS 140-2 security requirements and how to operate the modules in a FIPS compliant manner. This policy was created as part of the FIPS 140-2 Level 2 validation of the modules.

The Federal Information Processing Standards Publication 140-2 - *Security Requirements for Cryptographic Modules* (FIPS 140-2) details the United States Federal Government requirements for cryptographic modules. Detailed information about the FIPS 140-2 standard and validation program is available on the NIST (National Institute of Standards and Technology) website at <http://csrc.nist.gov/groups/STM/cmvp/index.html>.

References

This policy deals specifically with operation and implementation of the modules in the technical terms of the FIPS 140-2 standard and the associated validation program. Other Fortinet product manuals, guides and technical notes can be found at the Fortinet technical documentation website at <http://docs.fortinet.com>.

Introduction

The FortiGate product family spans the full range of network environments, from SOHO to service provider, offering cost effective systems for any size of application. FortiGate appliances detect and eliminate the most damaging, content-based threats from email and Web traffic such as viruses, worms, intrusions, inappropriate Web content and more in real time — without degrading network performance. In addition to providing application level firewall protection, FortiGate appliances deliver a full range of network-level services — VPN, intrusion prevention, web filtering, antivirus, antispam and traffic shaping — in dedicated, easily managed platforms.

All FortiGate appliances employ Fortinet's unique FortiASIC content processing chip and the powerful, secure, FortiOS firmware achieve breakthrough price/performance. The unique, ASIC-based architecture analyzes content and behavior in real time, enabling key applications to be deployed right at the network edge where they are most effective at protecting enterprise networks. They can be easily configured to provide antivirus protection, antispam protection and content filtering in conjunction with existing firewall, VPN, and related devices, or as complete network protection systems. The modules support High Availability (HA) in both Active-Active (AA) and Active-Passive (AP) configurations.

FortiGate appliances support the IPsec industry standard for VPN, allowing VPNs to be configured between a FortiGate appliance and any client or gateway/firewall that supports IPsec VPN. FortiGate appliances also provide SSL VPN services using TLS 1.2.

Security Level Summary

The modules meet the overall requirements for a FIPS 140-2 Level 2 validation.

Table 1: Summary of FIPS security requirements and compliance levels

Security Requirement	Compliance Level

Mitigation of Other Attacks	2

Module Descriptions

The FortiGate-100E, 201E, 300D, 600D and FortiGate-800D are multiple chip, standalone cryptographic modules consisting of production grade components contained in a physically protected enclosure in accordance with FIPS 140-2 Level 2 requirements.

The modules have a similar appearance and perform the same functions, but have different numbers and types of network interfaces in order to support different network configurations:

- The FortiGate-100E has 24 network interfaces with status LEDs for each network interface (22x 10/100/1000 Base-T, 2x 1GB SFP).
- The FortiGate-201E has 22 network interfaces with status LEDs for each network interface (18x 10/100/1000 Base-T, 4x 1GB SFP).
- The FortiGate-300D has 10 network interfaces with status LEDs for each network interface (6x 10/100/1000 Base-T, 4x 1GB SFP).
- The FortiGate-600D has 20 network interfaces status LEDs for each network interface (10x 10/100/1000 Base-T, 8x 1GB SFP, 2x 10GB SFP+).
- The FortiGate-800D has 36 network interfaces status LEDs for each network interface (26x 10/100/1000 Base-T, 2x 10/100/1000 Base-T paired bypass ports, 10x 1GB SFP)

The modules each have one x86 compatible CPU.

The modules are 1U rackmount devices.

The validated firmware version for the FortiGate-300D, 600D and 800D is FortiOS 5.4, b9791, 170802.

The validated firmware version for the FortiGate-100E is FortiOS 5.4, b3141, 170602.

The validated firmware version for the FortiGate-201E is FortiOS 5.4, b3144, 170602.

Any firmware version that is not shown on the module certificate is out of scope of this validation and requires a separate FIPS 140-2 validation.

Figures 1 to 5 are representative of the modules tested.

The FortiGate-800D module also has 2 bypass interfaces that are paired with WAN ports 1 and 2. If bypass is enabled, these interfaces provide a physical bypass of the paired port if the module fails, hangs or loses power. Use of the bypass capability is a non-FIPS approved service.

Cryptographic Module Ports and Interfaces

All of the modules have status LEDs as described in the following table:

Table 2: Module Status LEDs

LED		State	Description
Power		Green	The module is powered on.
		Off	The module is powered off.
Status		Green	The module is running normally.
		Flashing	The module is starting up.
		Off	The module is powered off.
HA		Green	HA is enabled.
		Off	The unit is in standalone mode.
Alarm		Red	The unit has a major alarm.
		Amber	The unit has a minor alarm.
		Off	The unit is operating normally.
Ethernet Ports	Link/ACT	Green	Port is connected.
		Flashing	Port is sending/receiving data.
		Off	No link established.
	Speed	Green	Connected at 1000 Mbps.
		Amber	Connected at 100 Mbps
		Off	Connected at 10 Mbps
SFP and SFP+ Ports		Green	Port is connected.
		Flashing	Port is sending/receiving data.
		Off	No link established.

FortiGate-100E

Table 4: FortiGate-201E Connectors and Ports

Connector	Type	Speed	Supported Logical Interfaces	Description
MGMT, HA, WAN Ports and Ports 1-14	RJ-45	10/100/1000 Base-T	Data input, data output, control input, and status output	Copper gigabit connection to 10/100/1000 copper networks.
Ports 15-18	SFP	1 Gbps	Data input, data output, control input, and status output	Multimode fiber optic connections to gigabit optical networks.
USB Port	USB-A	N/A	Key loading and archiving, entropy input	Optional USB token and entropy token.
Console Port	RJ-45	9600 bps	Control input, status output	Optional connection to the management computer. Provides access to the command line interface (CLI).
DC Power	N/A	N/A	Power	+12VDC power connection
AC Power	N/A	N/A	Power	120/240VAC power connection.

FortiGate-300D

Figure 3 - FortiGate-300D Front and Rear Panels

Table 5: FortiGate-300D Connectors and Ports

Connector	Type	Speed	Supported Logical Interfaces	Description
MGMT Ports and Ports 1-4	RJ-45	10/100/1000 Base-T	Data input, data output, control input, and status output	Copper gigabit connection to 10/100/1000 copper networks.
Ports 5-8	SFP	1 Gbps	Data input, data output, control input and status output	Multimode fiber optic connections to gigabit optical networks.
USB Ports	USB-A	N/A	Key loading and archiving, entropy input	Optional USB token and entropy token.
USB ManagementPort	USB Mini-B	N/A	Control input, status output	Optional connection for management or configuration using FortiExplorer.

Connector	Type	Speed	Supported Logical Interfaces	Description
Console Port	RJ-45	9600 bps	Control input, status output	Optional connection to the management computer. Provides access to the command line interface (CLI).
DC Power	N/A	N/A	Power	+12VDC power connection
AC Power	N/A	N/A	Power	120/240VAC power connection.

FortiGate-600D

Figure 4 - FortiGate-600D Front and Rear Panels

Table 6: FortiGate-600D Connectors and Ports

Connector	Type	Speed	Supported Logical Interfaces	Description
MGMT Ports and Ports 9-16	RJ-45	10/100/1000 Base-T	Data input, data output, control input, and status output	Copper gigabit connection to 10/100/1000 copper networks.
Ports 1-8	SFP	1 Gbps	Data input, data output, control input and status output	Multimode fiber optic connections to gigabit optical networks.

Connector	Type	Speed	Supported Logical Interfaces	Description
Ports 17-18	SFP+	10 Gbps	Data input, data output, control input and status output	Multimode fiber optic connections to gigabit optical networks.
USB Ports	USB-A	N/A	Key loading and archiving, entropy input	Optional USB token and entropy token.
Console Port	RJ-45	9600 bps	Control input, status output	Optional connection to the management computer. Provides access to the command line interface (CLI).
DC Power	N/A	N/A	Power	+12VDC power connection
AC Power	N/A	N/A	Power	120/240VAC power connection.

FortiGate-800D

Figure 5 - FortiGate-800D Front and Rear Panels

Table 7: FortiGate-800D Connectors and Ports

Connector	Type	Speed	Supported Logical Interfaces	Description
MGMT, WAN, Bypass Ports and Ports 3-22	RJ-45	10/100/1000 Base-T	Data input, data output, control input, and status output	Copper gigabit connection to 10/100/1000 copper networks.
Ports 23-32	SFP+	10 Gbps	Data input, data output, control input and status output	Multimode fiber optic connections to gigabit optical networks.
USB Ports	USB-A	N/A	Key loading and archiving, entropy input	Optional USB token and entropy token.
Console Port	RJ-45	9600 bps	Control input, status output	Optional connection to the management computer. Provides access to the command line interface (CLI).
AC Power	N/A	N/A	Power	120/240VAC power connection.

Web-Based Manager

The FortiGate web-based manager provides GUI based access to the modules and is the primary tool for configuring the modules. The manager requires a web browser on the management computer and an Ethernet connection between the FortiGate unit and the management computer.

A web-browser that supports Transport Layer Security (TLS) 1.2 is required for remote access to the web-based manager when the module is operating in FIPS-CC mode. HTTP access to the web-based manager is not allowed in FIPS mode and is disabled.

Figure 6 - The FortiGate web-based manager

Command Line Interface

The FortiGate Command Line Interface (CLI) is a full-featured, text based management tool for the module. The CLI provides access to all of the possible services and configuration options in the module. The CLI uses a console connection or a network (Ethernet) connection between the FortiGate unit and the management computer. The console connection is a direct serial connection. Terminal emulation software is required on the management computer using either method. For network access, a Telnet or SSH client that supports the SSH v2.0 protocol is required (SSH v1.0 is not supported in FIPS mode). Telnet access to the CLI is not allowed in FIPS mode and is disabled.

Roles, Services and Authentication

Roles

When configured in FIPS mode, the module provides the following roles:

- Crypto Officer
- Network User

The Crypto Officer role is initially assigned to the default 'admin' operator account. The Crypto Officer role has read-write access to all of the module's administrative services. The initial Crypto Officer can create additional operator accounts. These additional accounts are assigned the Crypto Officer role and can be assigned a range of read/write or read only access permissions including the ability to create operator accounts.

The modules also provide a **Network User** role for end-users (Users). Network Users can make use of the encrypt/decrypt services, but cannot access the modules for administrative purposes.

The module does not provide a Maintenance role.

FIPS Approved Services

The following tables detail the types of FIPS approved services available to each role in each mode of operation, the types of access for each role and the Keys or CSPs they affect.

The access types are abbreviated as follows:

Read Access	R
Write Access	W
Execute Access	E

Table 8: Services available to Crypto Officers

Service	Access	Key/CSP
connect to module locally using the console port	WE	N/A
connect to module remotely using TLS*	WE	Diffie-Hellman Key, EC Diffie Hellman Key, HTTPS/TLS Server/Host Key, HTTPS/TLS Session Authentication Key, and HTTPS/TLS Session Encryption Key, DRBG v and key values, DRBG Output, DRBG Seed, NDRNG Output String

Service	Access	Key/CSP
connect to module remotely using SSH*	WE	Diffie-Hellman Key, SSH Server/Host Key, SSH Session Authentication Key, SSH Session Encryption Key, DRBG v and key values, DRBG Output, DRBG Seed, NDRNG Output String
authenticate to module	WE	Crypto Officer Password
show system status	N/A	N/A
show FIPS-CC mode enabled/disabled (console/CLI only)	N/A	N/A
enable FIPS-CC mode of operation (console only)	WE	Configuration Integrity Key
key zeroization	W	All Keys
execute factory reset (disable FIPS-CC mode, console/CLI only)	W	All keys stored in Flash RAM
execute FIPS-CC on-demand self-tests (console only)	E	Configuration Integrity Key, Firmware Integrity Key
add/delete crypto officers and network users	WE	Crypto Officer Password, Network User Password
set/reset crypto officers and network user passwords	WE	Crypto Officer Password, Network User Password
backup/restore configuration file	RWE	Configuration Encryption Key, Configuration Backup Key
read/set/delete/modify module configuration*	N/A	N/A
execute firmware update	WE	Firmware Update Key
read log data	N/A	N/A
delete log data (console/CLI only)	N/A	N/A
execute system diagnostics (console/CLI only)	N/A	N/A
enable/disable alternating bypass mode	N/A	N/A

Service	Access	Key/CSP
read/set/delete/modify IPsec/SSL VPN configuration*	W	IPsec: IPsec Manual Authentication Key, IPsec Manual Encryption Key, IKE Pre-Shared Key, IKE RSA Key, IKE ECDSA Key, Diffie-Hellman Key, EC Diffie-Hellman Key SSL: HTTPS/TLS Server/Host Key, HTTPS/TLS Session Authentication Key, HTTPS/TLS Session Encryption Key
read/set/modify HA configuration	WE	HA Password, HA Encryption Key

Table 9: Services available to Network Users in FIPS-CC mode

Service/CSP	Access	Key/CSP
connect to module remotely using TLS*	WE	Diffie-Hellman Key, EC Diffie-Hellman Key, HTTPS/TLS Server/Host Key, HTTPS/TLS Session Authentication Key, HTTPS/TLS Session Encryption Key, DRBG v and key values, DRBG Output, DRBG Seed, NDRNG Output String
authenticate to module	WE	Network User Password
IPsec VPN controlled by firewall policies*	E	Diffie-Hellman Key, EC Diffie-Hellman Key, all IKE and IPsec Key, DRBG v and key values, DRBG Output, DRBG Seed, NDRNG Output String
SSL VPN controlled by firewall policies*	E	Network User Password, Diffie-Hellman Key, EC Diffie-Hellman Key, HTTPS/TLS Server/Host Key, HTTPS/TLS Session Authentication Key, HTTPS/TLS Session Encryption Key, DRBG v and key values, DRBG Output, DRBG Seed, NDRNG Output String

Non-FIPS Approved Services

The module also provides the following non-FIPS approved services:

- Configuration backups using password protection
- L2TP and PPTP VPN
- Services marked with an asterisk (*) in Tables 8 and 9 are considered non-approved when using the following algorithms:

- Non-compliant-strength Diffie-Hellman
- Non-compliant-strength RSA key wrapping

The above services shall not be used in the FIPS approved mode of operation.

Authentication

The module implements identity based authentication. Operators must authenticate with a user-id and password combination to access the modules remotely or locally via the console. Remote operator authentication is done over HTTPS (TLS) or SSH. The password entry feedback mechanism does not provide information that could be used to guess or determine the authentication data.

By default, Network User access to the modules is based on firewall policy and authentication by IP address or fully qualified domain names. Network Users can optionally be forced to authenticate to the modules using a username/password combination to enable use of the IPsec VPN encrypt/decrypt or bypass services. For Network Users invoking the SSL-VPN encrypt/decrypt services, the modules support authentication with a user-id/password combination. Network User authentication is done over HTTPS and does not allow access to the modules for administrative purposes.

The minimum password length is 8 characters when in FIPS-CC mode (maximum password length is 32 characters) chosen from the set of ninety four (94) characters. New passwords are required to include 1 uppercase character, 1 lowercase character, 1 numeric character, and 1 special character. The odds of guessing a password are 1 in $\{(10)^*(26^2)^*(32)^*(94^4)\}$ which is significantly lower than one in a million.

Note that operator authentication over HTTPS/SSH and Network User authentication over HTTPS are subject to a limit of 3 failed authentication attempts in 1 minute; thus, the maximum number of attempts in one minute is 3. Therefore the probability of a success with multiple consecutive attempts in a one-minute period is 3 in $\{(10)^*(26^2)^*(32)^*(94^4)\}$ which is less than 1/100,000. Operator authentication using the console is not subject to a failed authentication limit, but the number of authentication attempts per minute is limited by the bandwidth available over the serial connection which is a maximum of 115,200 bps which is 6,912,000 bits per minute. An 8 byte password would have 64 bits, so there would be no more than 108,000 passwords attempts per minute. Therefore the probability of success would be $1/\{(10)^*(26^2)^*(32)^*(94^4)\} / 108,000$ which is less than 1/100,000.

For Network Users invoking the IPsec VPN encrypt/decrypt services, the module acts on behalf of the Network User and negotiates a VPN connection with a remote module. The strength of authentication for IPsec services is based on the authentication method defined in the specific firewall policy: IPsec manual authentication key, IKE pre-shared key, IKE RSA key (RSA certificate) or IKE ECDSA key (ECDSA certificate). The odds of guessing the authentication key for each IPsec method is:

- 1 in 16^{40} for the IPsec Manual Authentication key (based on a 40 digit, hexadecimal key)
- 1 in 94^8 for the IKE Pre-shared Key (based on an 8 character, ASCII printable key)
- 1 in 2^{112} for the IKE RSA Key (based on a 2048bit RSA key size)
- 1 in 2^{128} for the IKE ECDSA Key (based on a P-256 curve ECDSA key size)

Therefore the minimum odds of guessing the authentication key for IPsec is 1 in 94^8 , based on the IKE Pre-shared key.

Physical Security

The modules meet FIPS 140-2 Security Level 2 requirements by using production grade components and an opaque, sealed enclosure. Access to the enclosure is restricted through the use of tamper-evident seals to secure

the overall enclosure. The tamper-evident seals shall be installed for the module to operate in a FIPS Approved mode of operation. All Networking devices need tamper-evident seals to meet the FIPS 140-2 Level 2 Physical Security requirements.

The seals are red wax/plastic with black lettering that reads “Fortinet Security Seal”.

The tamper seals are not applied at the factory prior to shipping. It is the responsibility of the Crypto Officer to apply the seals before use to ensure full FIPS 140-2 compliance. Once the seals have been applied, the Crypto Officer must develop an inspection schedule to verify that the external enclosure of the modules and the tamper seals have not been damaged or tampered with in any way. Upon viewing any signs of tampering, the Crypto Officer must assume that the device has been fully compromised. The Crypto Officer is required to zeroize the cryptographic module by following the steps in the Key Zeroization section of the SP.

The Crypto Officer is responsible for securing and controlling any unused seals. The Crypto Office is also responsible for the direct control and observation of any changes to the modules such as reconfigurations where the tamper-evident seals are removed or installed to ensure the security of the module is maintained during such changes and ensuring the module is returned to a FIPS approved state.

The surfaces should be cleaned with 99% Isopropyl alcohol to remove dirt and oil before applying the seals. Ensure the surface is completely clean and dry before applying the seals. If a seal needs to be re-applied, completely remove the old seal and clean the surface with an adhesive remover before following the instructions for applying a new seal. Allow 12 hours for the seals to fully cure.

Additional seals can be requested through your Fortinet sales contact. Reference the ‘FIPS-SEAL-RED’ SKU when ordering. Specify the number of seals required based on the specific model as described below:

- The FortiGate-100E uses one seal to secure the external enclosure (see Figure 7).
- The FortiGate-201E uses one seal to secure the external enclosure (see Figure 8).
- The FortiGate-300D uses one seal to secure the external enclosure (see Figure 9).
- The FortiGate-600D uses one seal to secure the external enclosure (see Figure 10).
- The FortiGate-800D uses one seal to secure the external enclosure (see Figure 11).

Figure 10 - FortiGate-600D external enclosure seal, top, rear

Figure 11 - FortiGate-800D external enclosure seal, bottom, left side

Operational Environment

The modules consist of the combination of the FortiOS operating system and the FortiGate appliances. The FortiOS operating system can only be installed, and run, on a FortiGate appliance. The FortiOS operating system provides a proprietary and non-modifiable operating system.

Cryptographic Key Management

Random Number Generation

The modules use a firmware based, deterministic random bit generator (DRBG) that conforms to NIST Special Publication 800-90A.

Entropy

The module uses a Fortinet entropy token (part number FTR-ENT-1 or part number FTR-ENT-2) to seed the DRBG during the modules' boot process and to periodically reseed the DRBG. The entropy token is not included in the boundary of the module and therefore no assurance can be made for the correct operation of the entropy token nor is there a guarantee of stated entropy.

Entropy Strength

The entropy loaded into the approved AES-256 bit DRBG is 256 bits. The entropy source is over-seeded and then an HMAC-SHA-256 post-conditioning component is applied.

Reseed Period

The RBG is seeded from the entropy token during the boot process and then reseeded periodically. The default reseed period is once every 24 hours (1440 minutes) and is configurable (1 to 1440 minutes). The entropy token must be installed to complete the boot process and to reseed the DRBG.

Key Zeroization

The zeroization process must be performed under the direct control of the operator. The operator must be present to observe that the zeroization method has completed successfully.

All keys and CSPs are zeroized by erasing the module's boot device and then power cycling the FortiGate unit. To erase the boot device, execute the following command from the CLI:

```
execute erase-disk <boot device>
```

The boot device ID may vary depending on the FortiGate module. Executing the following command will output a list of the available internal disks:

```
execute erase-disk ?
```

Algorithms

Table 10: FIPS approved algorithms

Algorithm	NIST Certificate Number
CTR DRBG (NIST SP 800-90A) with AES 256-bits	1543
AES in CBC mode (128-, 256-bits)	4602, 4604, 4607, 4628
AES in GCM mode (128-, 256-bits)	4602, 4607, 4628
SHA-1	3777, 3779, 3781, 3792
SHA-256	3777, 3779, 3781, 3792
SHA-384	3777, 3781, 3792
SHA-512	3777, 3781, 3792
HMAC SHA-1	3050, 3052, 3053, 3063
HMAC SHA-256	3050, 3052, 3053, 3063

Algorithm	NIST Certificate Number
HMAC SHA-384	3050, 3053, 3063
HMAC SHA-512	3050, 3053, 3063
RSA PKCS1 <ul style="list-style-type: none"> • Key Pair Generation: 2048 and 3072-bit • Key Pair Generation: 2048-bit • Signature Generation: 2048 and 3072-bit • Signature Verification: 1024, 2048 and 3072-bit • For legacy use, the module supports 1024-bit RSA keys and SHA-1 for signature verification 	2526 2510, 2512, 2526 2510, 2512, 2526 2510, 2512, 2526
ECDSA <ul style="list-style-type: none"> • Key Pair Generation: curves P-256, P-384 and P-521 • Signature Generation: curves P-256, P-384 and P-521 • Signature Verification: curves P-256, P-384 and P-521 	1130, 1137 1130, 1137 1129, 1130, 1137

CKG (NIST SP 800-133)	Vendor Affirmed

KTS (AES Cert. #4628 and HMAC Cert. #3063; key establishment methodology provides 128 or 256 bits of encryption strength).

In accordance with FIPS 140-2 IG D.12, the cryptographic module performs Cryptographic Key Generation (CKG) as per SP800-133 (vendor affirmed). The resulting generated symmetric key and the seed used in the asymmetric key generation are the unmodified output from SP800-90A DRBG.

There are algorithms, modes, and keys that have been CAVs tested but are not available when the module is configured for FIPS compliant operation. Only the algorithms, modes/methods, and key lengths/curves/moduli shown in this table are supported by the module in the FIPS validated configuration.

Table 11: FIPS allowed algorithms

Algorithm
RSA (CVL Certs. #1272 and #1287, key wrapping; key establishment methodology provides 112 or 128 bits of encryption strength)

Algorithm
Diffie-Hellman (CVL Certs. #1272 and #1287, key agreement; key establishment methodology provides between 112 and 201 bits of encryption strength)
EC Diffie-Hellman (CVL Certs. #1272 and #1287, key agreement; key establishment methodology provides between 128 and 256 bits of encryption strength)
NDRNG (Entropy Token)
MD5 (used in the TLS protocol only)

Table 12: Non-FIPS approved algorithms

Algorithm
RSA is non-compliant when keys less than 2048 bits are used, since such keys do not provide the minimum required 112 bits of encryption strength
Diffie-Hellman is non-compliant when keys less than 2048 bits are used, since such keys do not provide the minimum required 112 bits of encryption strength

Note that the IKE, SSH and TLS protocols, other than the KDF, have not been tested by the CMVP or CAVP as per FIPS 140-2 Implementation Guidance D.11.

The module is compliant to IG A.5: GCM is used in the context of TLS and IKEv2/IPSec.

For TLS, The GCM implementation meets Option 1 of IG A.5: it is used in a manner compliant with SP 800-52 and in accordance with RFC 5246 for TLS key establishment. The AES GCM IV generation is in compliance with RFC 5288 and shall only be used for the TLS protocol version 1.2 to be compliant with FIPS140-2 IG A.5, Option 1 ("TLS protocol IV generation"); thus, the module is compliant with [SP800-52]. During operational testing, the module was tested against an independent version of TLS and found to behave correctly.

For IPsec/IKEv2, the GCM implementation meets Option 1 of IG A.5: it is used in a manner compliant with RFCs 4106 and 7296. During operational testing, the module was tested against an independent version of IPsec with IKEv2 and found to behave correctly.

In case the module's power is lost and then restored, the key used for the AES GCM encryption or decryption shall be re-distributed.

Cryptographic Keys and Critical Security Parameters

The following table lists all of the cryptographic keys and critical security parameters used by the modules. The following definitions apply to the table. Note that "Automatic" generation is defined as Electronic Entry/Electronic Distribution as per IG 7.7.

Table 13: Cryptographic Keys and Critical Security Parameters used in FIPS-CC mode

Key or CSP	Generation	Storage	Usage	Zeroization
NDRNG output string	Automatic	Boot device Plain-text	Input string for the entropy pool (5120-bits)	By erasing the Boot device and power cycling the module
DRBG seed	Automatic	Boot device Plain-text	256-bit seed used by the DRBG (output from NDRNG)	By erasing the Boot device and power cycling the module
DRBG output	Automatic	Boot device Plain-text	Random numbers used in cryptographic algorithms (256-bits)	By erasing the Boot device and power cycling the module
DRBG v and key values	Automatic	Boot device Plain-text	Internal state values for the DRBG	By erasing the Boot device and power cycling the module
IPsec Manual Authentication Key	Manual	Boot device AES encrypted	Used as IPsec Session Authentication Key	By erasing the Boot device and power cycling the module
IPsec Manual Encryption Key	Automatic	SDRAM Plain-text	Used as IPsec Session Encryption Key using AES (128-, 256-bit)	By erasing the Boot device and power cycling the module
IPsec Session Authentication Key	Automatic	SDRAM Plain-text	IPsec peer-to-peer authentication using HMAC SHA-1 or HMAC SHA-256	By erasing the Boot device and power cycling the module
IPsec Session Encryption Key	Automatic	SDRAM Plain-text	VPN traffic encryption/decryption using AES (128-,256-bit)	By erasing the Boot device and power cycling the module
IKE SKEYSEED	Automatic	SDRAM Plain-text	Used to generate IKE protocol keys	By erasing the Boot device and power cycling the module
IKE Pre-Shared Key	Manual	Boot device AES encrypted	Used to generate IKE protocol keys	By erasing the Boot device and power cycling the module
IKE Authentication Key	Automatic	SDRAM Plain-text	IKE peer-to-peer authentication using HMAC SHA-1 , -256, -384 or -512	By erasing the boot device and power cycling the module

Key or CSP	Generation	Storage	Usage	Zeroization
IKE Key Generation Key	Automatic	SDRAM Plain-text	IPsec SA keying material	By erasing the boot device and power cycling the module
IKE Session Encryption Key	Automatic	SDRAM Plain-text	Encryption of IKE peer-to-peer key negotiation using or AES (128-, 256-bit)	By erasing the boot device and power cycling the module
IKE RSA Key	Manual	Boot device Plain-text	Used to generate IKE protocol keys (2048- and 3072-bit signatures)	By erasing the boot device and power cycling the module
IKE ECDSA Key	Manual	Boot device Plain-text	Used to generate IKE protocol keys (signatures using P-256, -384 and -521 curves)	By erasing the boot device and power cycling the module
Diffie-Hellman Keys	Automatic	SDRAM Plain-text	Key agreement and key establishment (2048-8192 bits)	By erasing the boot device and power cycling the module
EC Diffie-Hellman Keys	Automatic	SDRAM Plain-text	Key agreement and key establishment (key pairs on the curves secp256r1, secp384r1 and secp521r1)	By erasing the boot device and power cycling the module
Firmware Update Key	Preconfigured	Boot device Plain-text	Verification of firmware integrity when updating to new firmware versions using RSA public key (firmware load test, 2048-bit signature)	By erasing the boot device and power cycling the module
Firmware Integrity Key	Preconfigured	Boot device Plain-text	Verification of firmware integrity in the firmware integrity test using RSA public key (firmware integrity test, 2048-bit signature)	By erasing the boot device and power cycling the module
HTTPS/TLS Server/Host Key	Preconfigured	Boot device Plain-text	RSA private key used in the HTTPS/TLS protocols (key establishment, 2048- or 3072-bit)	By erasing the boot device and power cycling the module

Key or CSP	Generation	Storage	Usage	Zeroization
HTTPS/TLS Session Authentication Key	Automatic	SDRAM Plain-text	HMAC SHA-1, -256 or -384 key used for HTTPS/TLS session authentication	By erasing the boot device and power cycling the module
HTTPS/TLS Session Encryption Key	Automatic	SDRAM Plain-text	AES (128-, 256-bit) key used for HTTPS/TLS session encryption	By erasing the boot device and power cycling the module
SSH Server/Host Key	Preconfigured	Boot device Plain-text	RSA private key used in the SSH protocol (key establishment, 2048- or 3072-bit)	By erasing the boot device and power cycling the module
SSH Session Authentication Key	Automatic	SDRAM Plain-text	HMAC SHA-1 or HMAC SHA-256 key used for SSH session authentication	By erasing the boot device and power cycling the module
SSH Session Encryption Key	Automatic	SDRAM Plain-text	AES (128-, 256-bit) key used for SSH session encryption	By erasing the boot device and power cycling the module
Crypto Officer Password	Manual	Boot device SHA-1 hash	Used to authenticate operator access to the module	By erasing the boot device and power cycling the module
Configuration Integrity Key	Preconfigured	Boot device Plain-text	HMAC SHA-256 hash used for configuration integrity test	By erasing the boot device and power cycling the module
Configuration Encryption Key	Preconfigured	Boot device Plain-text	AES 256-bit key used to encrypt CSPs on the Boot device and in the backup configuration file (except for crypto officer passwords in the backup configuration file)	By erasing the boot device and power cycling the module
Configuration Backup Key	Preconfigured	Boot device Plain-text	HMAC SHA-256 key used to hash crypto officer passwords in the backup configuration file	By erasing the boot device and power cycling the unit
Network User Password	Manual	Boot device SHA-1 hash	Used to authenticate network access to the module	By erasing the boot device and power cycling the unit

Key or CSP	Generation	Storage	Usage	Zeroization
HA Password	Manual	Boot device AES encrypted	Used to authenticate FortiGate units in an HA cluster	By erasing the boot device and power cycling the unit
HA Encryption Key	Manual	Boot device AES encrypted	Encryption of traffic between units in an HA cluster using AES 128-bit key	By erasing the boot device and power cycling the unit

The Generation column lists all of the keys/CSPs and their entry/generation methods. Manual entered keys are entered by the operator electronically (as defined by FIPS) using the console or a management computer. Pre-configured keys are set as part of the firmware (hardcoded) and are not operator modifiable.

Alternating Bypass Feature

The primary cryptographic function of the module is as a firewall and VPN device. The module implements two forms of alternating bypass for VPN traffic: policy based (for IPsec and SSL VPN) and interface based (for IPsec VPN only).

Policy Based VPN

Firewall policies with an action of IPsec or SSL-VPN mean that the firewall is functioning as a VPN start/end point for the specified source/destination addresses and will encrypt/decrypt traffic according to the policy. Firewall policies with an action of allow mean that the firewall is accepting/sending plaintext data for the specified source/destination addresses.

A firewall policy with an action of accept means that the module is operating in a bypass state for that policy. A firewall policy with an action of IPsec or SSL-VPN means that the module is operating in a non-bypass state for that policy.

Interface Based VPN

Interface based VPN is supported for IPsec only. A virtual interface is created and any traffic routed to the virtual interface is encrypted and sent to the VPN peer. Traffic received from the peer is decrypted. Traffic through the virtual interface is controlled using firewall policies. However, unlike policy based VPN, the action is restricted to Accept or Deny and all traffic controlled by the policy is encrypted/decrypted.

When traffic is routed over the non-virtual interfaced, the module is operating in a bypass state. When traffic is routed over the virtual interface, the module is operating in a non-bypass state.

Key Archiving

The module supports key archiving to a management computer as part of the module configuration file backup. Operator entered keys are archived as part of the module configuration file. The configuration file is stored in

plain text, but keys in the configuration file are either AES encrypted using the Configuration Encryption Key or stored as a keyed hash using HMAC SHA-256 using the Configuration Backup Key.

Mitigation of Other Attacks

The module includes a real-time Intrusion Prevention System (IPS) as well as antivirus protection, antispam and content filtering. Use of these capabilities is optional.

The FortiOS IPS has two components: a signature based component for detecting attacks passing through the FortiGate appliance and a local attack detection component that protects the firewall from direct attacks. Functionally, signatures are similar to virus definitions, with each signature designed to detect a particular type of attack. The IPS signatures are updated through the FortiGuard IPS service. The IPS engine can also be updated through the FortiGuard IPS service.

FortiOS antivirus protection removes and optionally quarantines files infected by viruses from web (HTTP), file transfer (FTP), and email (POP3, IMAP, and SMTP) content as it passes through the FortiGate modules. FortiOS antivirus protection also controls the blocking of oversized files and supports blocking by file extension. Virus signatures are updated through the FortiGuard antivirus service. The antivirus engine can also be updated through the FortiGuard antivirus service.

FortiOS antispam protection tags (SMTP, IMAP, POP3) or discards (SMTP only) email messages determined to be spam. Multiple spam detection methods are supported including the FortiGuard managed antispam service.

FortiOS web filtering can be configured to provide web (HTTP) content filtering. FortiOS web filtering uses methods such as banned words, address block/exempt lists, and the FortiGuard managed content service.

Communications between the module and the FortiGuard servers is done securely over TLS using the FIPS approved algorithms and parameters.

Whenever a IPS, antivirus, antispam or filtering event occurs, the modules can record the event in the log and/or send an alert email to an operator.

For complete information refer to the FortiGate Installation Guide for the specific module in question, the FortiGate Administration Guide and the FortiGate IPS Guide.

Electromagnetic Interference/Electromagnetic Compatibility (EMI/EMC)

The modules comply with EMI/EMC requirements for Class A devices as specified by Part 15, Subpart B, of the FCC rules. The following table lists the specific lab and report information for the modules.

FCC Report Information

Module	Lab Information	FCC Report Number
FG-100E	Bay Area Compliance Laboratories Corp. 1274 Anvilwood Ave. Sunnyvale, CA 94089	R1609081-15
FG-201E	International Standards Laboratory No. 65 Gu Dai Keng Streed, His-chih Dist. New Taipei City 221, Taiwan	ISL-16LE310FA
FG-300D	Spectrum Research & Testing Lab., Inc. No. 167, Ln. 780, Shan-Tong Rd., Ling 8, Shan-Tong Li, Chung-Li City, Taoyuan County 320, Taiwan	FCAA14061702
FG-600D	Spectrum Research & Testing Lab., Inc. No. 167, Ln. 780, Shan-Tong Rd., Ling 8, Shan-Tong Li, Chung-Li City, Taoyuan County 320, Taiwan	FCAA14061702-02
FG-800D	Spectrum Research & Testing Lab., Inc. No. 167, Ln. 780, Shan-Tong Rd., Ling 8, Shan-Tong Li, Chung-Li City, Taoyuan County 320, Taiwan	FCAA15102206

FIPS 140-2 Compliant Operation

The Fortinet hardware is shipped in a non-FIPS 140-2 compliant configuration. The following steps must be performed to put the module into a FIPS compliant configuration:

1. Download the model specific FIPS validated firmware image from the Fortinet Support site at <https://support.fortinet.com/>
2. Verify the integrity of the firmware image
3. Install the FIPS validated firmware image
4. Install the entropy token
5. Enable the FIPS-CC mode of operation

These steps are described in detail in the "FIPS 140-2 and Common Criteria Compliant Operation for FortiOS 5.4" document that can be found on the Fortinet Technical Documentation website.

In addition, FIPS 140-2 compliant operation requires both that you use the module in its FIPS-CC mode of operation and that you follow secure procedures for installation and operation of the FortiGate unit. You must ensure that:

- The FortiGate unit is configured in the FIPS-CC mode of operation.
- The FortiGate unit is installed in a secure physical location.
- Physical access to the FortiGate unit is restricted to authorized operators.
- The Fortinet entropy token is enabled.
- The Fortinet entropy token remains in the USB port during operation.
- Administrative passwords are at least 8 characters long.
- Administrative passwords are changed regularly.
- Administrator account passwords must have the following characteristics:
 - One (or more) characters must be capitalized
 - One (or more) characters must be lower case
 - One (or more) characters must be numeric
 - One (or more) characters must be non alpha-numeric (e.g. punctuation mark)
- Administration of the module is permitted using only validated administrative methods. These are:
 - Console connection
 - Web-based manager via HTTPS
 - Command line interface (CLI) access via SSH
- Diffie-Hellman groups of less than 2048 bits are not used.
- Client side RSA certificates must use 2048 bit or greater key sizes.
- Only approved and allowed algorithms are used.
- IPsec VPN tunnels using AES-GCM should be configured with a key lifetime of 98,000 KB to ensure a rekey after a maximum of 2^{16} encryptions.

The module can be used in either of its two network operation modes: NAT/Route or Transparent. Note that "mode of operation" in this context does not refer or have any impact on the FIPS approved mode of operation. NAT/Route mode applies security features between two or more different networks (for example, between a private network and the Internet) where the module functions like a network router. Transparent mode applies security features at any point in a network where the module functions like a network bridge. The current

operation mode is displayed on the web-based manager status page and in the output of the `get system status` CLI command.

Once the FIPS validated firmware has been installed and the module properly configured in the FIPS-CC mode of operation, the module is running in a FIPS compliant configuration. It is the responsibility of the CO to ensure the module only uses approved algorithms and services to maintain the module in a FIPS-CC Approved mode of operation. Using any of the non-approved algorithms and services switches the module to a non-FIPS mode of operation. Prior to switching between modes the CO should ensure all keys and CSPs are zeroized to prevent sharing of keys and CSPs between the FIPS Approved and non-FIPS mode of operation.

Enabling FIPS-CC mode

To enable the FIPS 140-2 compliant mode of operation, the operator must execute the following command from the Local Console:

```
config system fips-cc
    set status enable
end
```

The Operator is required to supply a password for the admin account which will be assigned to the Crypto Officer role. The supplied password must be at least 8 characters long and correctly verified before the system will restart in FIPS-CC mode. Upon restart, the module will execute self-tests to ensure the correct initialization of the module's cryptographic functions.

After restarting, the Crypto Officer can confirm that the module is running in FIPS-CC mode by executing the following command from the CLI:

```
get system status
```

If the module is running in FIPS-CC mode, the system status output will display the line:

```
FIPS-CC mode: enable
```

Self-Tests

Startup and Initialization Self-tests

The module executes the following self-tests during startup and initialization:

- Firmware integrity test using RSA 2048-bit signatures
- Configuration/VPN bypass test using HMAC SHA-256
- Triple-DES, CBC mode, encrypt known answer test
- Triple-DES, CBC mode, decrypt known answer test
- AES, CBC mode, encrypt known answer test
- AES, CBC mode, decrypt known answer test
- AES, GCM mode, encrypt known answer test
- AES, GCM mode, decrypt known answer test
- HMAC SHA-1 known answer test
- SHA-1 known answer test (tested as part of HMAC SHA-1 known answer test)
- HMAC SHA-256 known answer test
- SHA-256 known answer test (tested as part of HMAC SHA-256 known answer test)
- HMAC SHA-384 known answer test
- SHA-384 known answer test (tested as part of HMAC SHA-384 known answer test)
- HMAC SHA-512 known answer test
- SHA-512 known answer test (tested as part of HMAC SHA-512 known answer test)
- RSA signature generation known answer test
- RSA signature verification known answer test
- ECDSA signature generation known answer test
- ECDSA signature verification known answer test
- DRBG known answer test

The results of the startup self-tests are displayed on the console during the startup process.

The startup self-tests can also be initiated on demand using the CLI command `execute fips kat all` (to initiate all self-tests) or `execute fips kat <test>` (to initiate a specific self-test).

When the self-tests are run, each implementation of an algorithm is tested - i.e. when the AES self-test is run, all AES implementations are tested.

Conditional Self-tests

The module executes the following conditional tests when the related service is invoked:

- Continuous NDRNG test
- Continuous DRBG test
- RSA pairwise consistency test

- ECDSA pairwise consistency test
- Configuration integrity test using HMAC SHA-256
- Firmware load test using RSA signatures

Critical Function Self-tests

The module also performs the following critical function self-tests applicable to the DRBG, as per NIST SP 800-90A Section 11:

- Instantiate test
- Generate test
- Reseed test
- Uninstantiate test

Error State

If any of the self-tests or conditional tests fail, the module enters an error state as shown by the console output below:

```
Self-tests failed
Entering error mode...
The system is going down NOW !!
The system is halted.
```

All data output and cryptographic services are inhibited in the error state.
