

# FIPS140-2 Security Policy for IBM CryptoLite in C (CLiC)

**FIPS140-2 Security Policy for  
CryptoLite in C (CLiC)**

**October 2003**

**Revision: 1. 3**

**NON CONFIDENTIAL**

**Status: Released**

First Edition (October 2003)

This edition applies to the First Edition of the IBM BlueZ – FIPS140-2 Security Policy for Crypto Lite in C and to all subsequent versions until otherwise indicated in new editions. IBM welcomes your comments on this publication. Please address them to: [bluez@zurich.ibm.com](mailto:bluez@zurich.ibm.com). When you send information to IBM, you grant IBM a nonexclusive right to use or distribute the information in any way it believes appropriate without incurring any obligation to you.

# 1. Document Information

---

## 1.1. Document Scope

---

This document is a non-proprietary FIPS 140-2 Security Policy for the IBM BlueZ ‘CryptoLite in C’ (CLiC), Version 3.0 (FIPS140/Prod) cryptographic module. It contains a specification of the rules under which the module must operate and describes how this module meets the requirements as specified in FIPS PUB 140-2 (Federal Information Processing Standards Publication 140-2) for a Level 1 multi-chip standalone module. This Policy forms a part of the submission package to the testing lab.

FIPS 140-2 specifies the security requirements for a cryptographic module protecting sensitive information. Based on four security levels for cryptographic modules this standard identifies requirements in eleven sections. For more information about the standard visit <http://csrc.nist.gov/publications/fips/fips140-2/fips1402.pdf>.

- For more information on the FIPS 140-2 standard and validation program please refer to the NIST website at <http://csrc.nist.gov/cryptval/>.
- For more information about IBM BlueZ software please visit <http://bluez@zurich.ibm.com>

**Table 1b: Module Component List for Unix**

### 3.2. Module Description

---

The IBM BlueZ CLiC Library, from hereon known as CLiC, consists of a single dynamically-linked library (DLL) named jclic\_sslite140.dll under MS Windows and a single loadable module named jclic\_sslite140.so on unix based systems. The cryptographic boundary for CLiC is defined as the enclosure of the computer system on which the cryptographic module is to be executed.

---

## 4. Security Levels

---

The IBM CLiC module meets the overall requirements applicable to Level 1 security of FIPS 140-2. The individual security requirements specified for FIPS 140-2 meets the level specifications indicated in the following table.

| <b>Security Requirements Section Level</b> |     |
|--|-----|
| Cryptographic Module                       | 1   |
| Ports and Interfaces                       | 1   |
| Roles and Services                         | 1   |
| Finite State Model                         | 1   |
| Physical Security                          | 1   |
| Operational Environment                    | 1   |
| Key Management                             | 1   |
| EMI/EMC                                    | 1   |
| Self-Tests                                 | 1   |
| Design Assurance                           | 1   |
| Mitigation of Other Attacks                | N/A |

**Table 2: FIPS 140-2 certification levels**

---

## 5. Cryptographic Module Specification

---

The IBM CLiC module is classified as a multi-chip standalone module for FIPS 140-2 purposes. As such, the CLiC Module must be tested upon a particular operating system and computer platform. The actual cryptographic boundary thus includes the CLiC Module running upon an IBM-compatible PC running the Windows™ 2000 Operating System (OS) or Red Hat Linux (version 8.0). The CLiC Module running on this platform was validated as meeting all FIPS 140-2 level 1 security requirements. The CLiC Module is packaged in a single DLL, named `jclic_sslite140.dll` or loadable module named `jclic_sslite140.so`, which contains all the code for the module. IBM CLiC also runs upon many other platforms including Windows '95, '98, and NT, Sun/Solaris, HP-UX, Linux, and AIX; however, the CLiC Module was not implemented and tested upon each of these platforms as part of this effort.

As outlined in G.5 of the Implementation Guidance for FIPS 140-2, the module maintains its compliance on other operating systems, provided:

- the GPC uses the specified single user operating system/mode specified on the validation certificate, or another compatible single user operating system, and
- the source code of the cryptographic module does not require modification prior to recompilation to allow porting to another compatible single user operating system.

The IBM CLiC module for Windows was tested and validated on the Microsoft Windows 2000 with Service Pack 4 operating system. The software module maintains compliance when running on the Microsoft Windows 95, Microsoft Windows 98, Microsoft Windows Me, Microsoft Windows NT, and Microsoft Windows XP operating systems.

The IBM CLiC module for Linux was tested and validated on the RedHat (Version 8.0) distribution of the Linux operating system. The software module maintains compliance when running on other Linux based distributions such as Suse.

| Hardware          | Operating System         |
|-------------------|--------------------------|
| IBM PC Compatible | Windows 2000, SP3        |
| IBM PC Compatible | RedHat Linux Version 8.0 |

**Table 3: Platforms on which CryptoLite has been tested**

The module provides no physical security features aside from the enclosure of the PC which the module runs on. Additionally, the computer that CryptoLite was tested on met the applicable FCC requirements. Finally, the module does not mitigate against any special attacks.

### 5.1. Cryptographic Standards

---

The IBM CLiC module supports the following approved and non approved FIPS algorithms.

#### HASH Services

| Algorithm | Specification  | FIPS Approved |
|-----------|--|---------------|
| MD2       | IETF RFC1319<br>Hash algorithm; hash size: 16 bytes; block size: 16 bytes. Used only for backward compatibility. | No            |

|               |  |     |
|---------------|--|-----|
| <b>MD5</b>    | <b>IETF RFC 1321</b><br>Hash algorithm; hash size: 16 bytes; block size: 64 bytes. Used only for backward compatibility. | No  |
| <b>SHA-1</b>  | <b>FIPS180-1</b><br>Hash algorithm; hash size: 20 bytes; block size: 64 bytes.   | Yes |
| <b>SHA256</b> | Hash algorithm; hash/block sizes: 32/64, bytes.  | No  |
| <b>SHA384</b> | Hash algorithm; hash/block sizes: 48/128 bytes.  | No  |
| <b>SHA512</b> | Hash algorithm; hash/block size 64/128 bytes.  | No  |

Table 4: Hash Services

#### CIPHER Services

| Algorithm                         | Specification & Description   | FIPS Approved |
|-----------------------------------|---|---------------|
| <b>RC2</b>                        | <b>IETF: RFC2268</b><br>Symmetric block cipher. Block size 8 bytes. Key size 0-1024 bits.<br>RC2 allows adjustment of the effective key strength independent of the input key length.   | No            |
| <b>RC4</b>                        | Stream cipher; key sizes: 0-2048 bits.  | No            |
| <b>RC6</b>                        | Symmetric block cipher; block size: 16 bytes; key sizes: 0-? bits.<br>RSA DSI Inc. candidate for <a href="#">AES</a>  | No            |
| <b>DES, DES-CBC</b>               | <b>FIPS 46-3</b><br>Symmetric block cipher; block size: 8 bytes; key size: 56 bits.   | Yes           |
| <b>3DES, 3DES-CBC</b>             | <b>FIPS 46-3</b><br>Triple DES has 112/168 bits key length depending on type of key.  | Yes           |
| <b>MDC1, MDC-2, MDC-4</b>         | Owned by IBM., Patent: US4908861<br>Modification detection codes (MDC) based on DES cipher. There are different schemes called MDC-1, MDC-2, and MDC-4. Mainly used for backward compatibility with main frame systems. Modern hash algorithms are much faster. | No            |
| <b>UNIX_CRYPT</b>                 | Unix password encryption based on a modified DES.   | No            |
| <b>AES<br/>AES CBC<br/>AES256</b> | <b>FIPS197</b><br>Symmetric block cipher; block sizes: 16,24,32 bytes; key sizes: 16,24,32 bytes.   | Yes           |
| <b>BLOWFISH</b>                   | Blowfish encryption/decryption and macing; bock-size: 8 bytes   | No            |
| <b>HMAC SHA-1</b>                 | Hashed Message Authentication Codes (HMAC) based on the SHA-1 hash algorithm.   | Yes           |

Table 5: Cipher Services

#### Public Key

| Algorithm                  | Specification  | FIPS Approved |
|----------------------------|--|---------------|
| <b>RSA Sign/Verify</b>     | Public key encryption/signature scheme. Typical key/data sizes: 512, 768, 1024 (typical), 2048 bits. | Yes           |
| <b>RSA Encrypt/Decrypt</b> | RSA specification and padding scheme:<br><a href="#">PKCS#1</a>                                      | No            |

|                        |   |     |
|------------------------|---|-----|
|                        | OAEP Padding scheme for RSA encryption:<br><a href="#">RFC2437</a><br>PSS padding scheme for RSA signatures:<br>Encryption, signing requires a padding scheme (typically PKCS#1, OAEP). |     |
| <b>DSA Sign/Verify</b> | Public key signature scheme. Cannot be used for encryption. Key sizes: 512-1024 bits in steps of 64 bits.   | Yes |
| <b>DH</b>              | Public key crypto system. Typical key/data sizes: 512, 768, 1024 (typical), 2048 bits. Used for key agreement.  | No  |

**Table 6: Public Key Services**

### Random Number Generators

| Algorithm  | Specification  | FIPS Approved |
|--|--|---------------|
| <b>PSEUDO Random Number Generator</b>                        | <b>FIPS 186-2</b><br><b>ANSI X9.31 1998</b>  | Yes           |
| <b>Universal Software Based True Random Number Generator</b> | Patented by IBM,<br>EC Pat.No. EP1081591A2,<br>True random number generator that works reliably on variety of platforms without exploiting platform specific features. Entropy evaluation through statistical analysis. Performance: 20-1000 bits/seconds. | No            |

**Table 7: Random Number Generator Services**

## 5.2. Module Interfaces

As a multi-chip standalone module, the CLiC Module's physical interfaces consist of the keyboard, mouse, monitor, serial ports, network adapters, etc. However, the underlying logical interface to the CLiC Module is a C- language Application Program Interface (API) documented in the CLiC Library Reference Manual. The module provides for Control Input with the exported DLL library API calls. Data Input and Output are provided in the variables passed with API calls, and Status Output is provided in the returns and error codes that are documented for each call. The CLiC Module is accessed from C/C++-language programs using the same method as the CLiC static toolkit, via the inclusion of the include file "CLiC.h".

## 5.3. Cryptographic Module Self Tests

The CLiC module implements a number of self-tests to check the proper functioning of the Module. This includes power-up self-tests and conditional self-tests. Conditional tests are performed when symmetric or asymmetric keys are generated. These tests include a continuous random number generator test and pair-wise consistency tests of the generated RSA keys.

### Startup Self-Tests

Power-up self-testing is initiated automatically when the CLiC module starts loading. (See the CLiC Finite State Machine for more details). These tests comprise of the software integrity test and the known answer tests of cryptographic algorithms. Should any of these tests fail; the CLiC module will terminate the loading process. The module cannot be used in this state.

---

The integrity of the module is verified by checking a HMAC SHA-1 of the all of the module file. The Initialization will only succeed if this HMAC SHA-1 is valid.

The CLiC module executes the following cryptographic algorithms tests:

- DES KAT
- 3DES KAT
- AES KAT
- SHA-1 KAT
- SHA256 KAT
- SHA384 KAT
- SHA512 KAT
- RSA\_SIGN/VERIFICATION
- RSA\_ENCRYPTION/DECRYPTION
- DSA\_PARAMETER\_GENERATION
- DSA\_SIGN/VERIFICATION
- RNG KAT

### **Startup Recovery**

Should the startup self tests fail during module initialization the crypto officer should reinstall the complete application.

### **Conditional Self-Testing**

This includes continuous PRNG testing. The very first output block generated by the PRNG is never used for any purpose other than initiating the continuous PRNG test which compares every newly generated block with the previously generated block. The test fails if newly generated PRNG output block matches the previously generated block. In such a case, the Module enters the Conditional Error state and all data output from the responsible function during the error condition is inhibited. It is the responsibility of the calling application to handle the exception, for example by retrying the PRNG service.

### **Pair-wise Consistency Self-Testing**

The test is run whenever the CLiC Module generates a private key. The private key structure of the Module always contains either the data of the corresponding public key or information sufficient for computing the corresponding public key.

## **5.4. Operational Environment**

---

The CLiC security module is written mostly in the C programming language that allows for extensive review to confirm security. CLiC is developed and maintained according to IBM's internal development standards and tools including CVS (Version 1.11.1p1) are used for configuration management.

The CLiC module implements both approved and non-approved services. The calling application controls the cryptographic material as well as the services that use them. It is the applications responsibility to ensure that when in a FIPS compliant mode, only those FIPS approved algorithms are used.

## **5.5. Module Status**

---

The module communicates any error status asynchronously through the use of return codes. It is the responsibility of the calling application to handle these exceptions.

---

## 6. Roles and Services

---

### 6.1. Roles

---

The CLiC module supports two roles, a cryptographic officer role and a user role.

- ROLE\_CO: The Cryptographic Officer Role is purely an administrative role and does not involve the use of any of the modules cryptographic services. The role is not explicitly authenticated but assumed implicitly on implementation of the modules installation and usage sections defined in the security rules section.
- ROLE\_USER: The User Role has access to all of the modules services. The role is not explicitly authenticated but assumed implicitly on access of any of the modules services.

| Role                       | Type of Authentication | Authentication Data |
|----------------------------|------------------------|---------------------|
| Cryptographic Officer Role | None                   | None                |
| User Role                  | None                   | None                |

**Table 8: Roles and Required Identification and Authentication**

### 6.2. Services

---

The modules services are accessed through API interfaces from the calling application.

| Services   | User Role |
|--|-----------|
| Self Tests   | Yes       |
| AES encryption/decryption, MACing and internal key generation services           | Yes       |
| Blowfish encryption/decryption, MACing. And internal key generation services     | Yes       |
| DES/3DES encryption/decryption and internal key generation services              | Yes       |
| Diffie-Hellman key exchange and parameter generation                             | Yes       |
| DSA signature generation, verification and parameter generation services.        | Yes       |
| Key Import and Export services   | Yes       |
| HMAC services  | Yes       |
| ISO 9796 message padding services  | Yes       |
| MARS encryption/decryption, MACing and internal parameter generation services.   | Yes       |
| MD2 secure hashing services  | Yes       |
| MD5 secure hashing services  | Yes       |
| Modification detection codes based on DES  | Yes       |
| RC2 encryption/decryption, MACing and internal parameter generation services     | Yes       |
| RC4 encryption and decryption and internal parameter generation services         | Yes       |
| RC5-W32 encryption/decryption, MACing and internal parameter generation services | Yes       |
| RC5-W64 encryption/decryption, MACing and internal parameter generation services | Yes       |
| RC6 encryption/decryption and MACing services                                    | Yes       |
| Random Number Services   | Yes       |

---

|  |     |
|--|-----|
| RSA decryption, encryption and key generation services | Yes |
| RSA signature and verification services                | Yes |
| SHA-1 secure hashing services                          | Yes |
| SHA-256 secure hashing services                        | Yes |

**Table 9: Services**

**Self Test Service**

A calling application can access the self test service at any time using the CLiC\_fips140SelfTests function.

---

## 7. Cryptographically Sensitive Material

---

### 7.1. Cryptographic Keys

---

#### **Key Storage**

The CLiC module does not provide long-term cryptographic key storage. If an application program makes use of CLiC service to implement cryptographic key storage functionality, it is a responsibility of the application program developers to ensure FIPS140-2 compliance of key storing techniques they implement.

#### **Key Protection**

The management and allocation of memory is the responsibility of the operating system. It is assumed that a unique process space is allocated for each request, and that the operating system and the underlying central processing unit (CPU) hardware control access to that space. Each instance of the cryptographic module is self-contained within a process space. All keys are associated with the User role. It is the responsibility of application program developers to protect keys exported from the CLiC Module.

#### **Key Import/Export**

CLiC provides applications key import and export routines such that key material can be used in conjunction with cryptographic services. It is the responsibility of the applications to ensure that these services are used in a FIPS compliant manner.

#### **Key Generation**

Key generation uses the FIPS approved RNG algorithm which is based on SHA-1. The RNG has a maximum number of internal states of  $2^{160}$ , this being limited by the compression function in SHA-1. The RSA and DH key generation algorithms use the RNG engine seeded with 20 bytes of true random data. This true random generator is based on IBM patented technology where statistical analysis used to estimate the entropy of the clock jitter. The internal RNG engine is enhanced using an automatic reseeding policy that insert a true random byte every 128 bytes of output if more than 30 seconds passed since last being reseeded. Applications can additionally provide their own seeding data and also increase the automatic reseeding policy of the internal RNG engine for example to add true random data every 8th byte without time constraint.

---

## 8. Security Rules

---

### Physical Environment

1. The host system is expected to be assembled with commercial grade components,
2. The enclosure should be opaque,
3. The enclosure should be protected by tamper-evident seals when appropriate.
4. The system bus must be secure.
5. The disk drive that CLiC module is installed on must be in a secure environment.

### Operating System

6. The cryptographic module is dependant on the operating system environment being set up in accordance with FIPS 140-2 specifications. This includes that the host operating system be restricted to a single operator mode.
7. Virtual (paged) memory must be secure (local disk or a secure network).

### Application Usage

8. The application shall ensure that keys are exchange in a FIPS compliant manner
9. The application shall ensure that only FIPS approved algorithms are used.
10. The Module is to be used by a single human operator at a time and may not be actively shared among operators at any period of time.
11. All keys entered into the module must be verified as being legitimate and belonging to the correct entity by software running on the same machine as the module.
12. The above rules must be upheld at all times in order to ensure continued system security and FIPS 140-2 mode compliance after initial setup of the validated configuration. If the module is removed from the above environment, it is assumed to not be operational in the validated mode until such time as it has been returned to the above environment and re-initialized by the user to the validated condition.

### Single User Guidelines

The following explains how to configure a Unix system for single user. The general idea is the same across all Unix variants:

- o Remove all login accounts except "root" (the superuser).
- o Disable NIS and other name services for users and groups.
- o Turn off all remote login, remote command execution, and file transfer daemons.

The Windows Operating Systems can be configured in single user mode by disabling all user accounts except the administrator. This can be done through the Computer Management window of the operating system. Additionally, the operating system must be configured to operate securely and to prevent remote login. This is accomplished by disabling all services (within the Administrative tools) that provide remote access (e.g. – ftp, telnet, ssh, and server) and disallowing multiple operators to log in at once.
