Overview

- 1 Background
 - ASCON-HASH
 - Notations
 - Basic Attack Strategy for Sponge-based Hash Functions
- 2 Our improvement
 - General 3-step attack strategy
 - Algebraic properties of the S-box
 - Improve the Attack
 - 4-Round Semi-free-start Attack
- 3 Conclusion and Future work

ASCON-HASH

- ASCON, a lightweight permutation-based primitive, NIST's lightweight cryptography standard.
- ASCON-HASH is one of the hash functions provided by ASCON.
- Sponge-based construction.
- 256-bit hash value.

Round Function of ASCON-HASH

■ Round function

$$S^i \xrightarrow{f_C} S^{i,a} \xrightarrow{f_S} S^{i,s} \xrightarrow{f_L} S^{i+1}$$

- $S^{i,a} = S^i[0] || S^i[1] || S^i[2] \oplus C_i || S^i[3] || S^i[4]$
- $S^{i,s} = \text{S-box}(S^{i,a})$
- $S^{i+1} = \Sigma_0(S^{i,s}[0]) || \Sigma_1(S^{i,s}[1]) || \Sigma_2(S^{i,s}[2]) || \Sigma_3(S^{i,s}[3]) || \Sigma_4(S^{i,s}[4])$

S-box and Linear Diffusion of ASCON-HASH

- 5-bit S-box for each 5-bit column.

$$\left\{ \begin{array}{l} y_0 = x_4x_1 \oplus x_3 \oplus x_2x_1 \oplus x_2 \oplus x_1x_0 \oplus x_1 \oplus x_0, \\ y_1 = x_4 \oplus x_3x_2 \oplus x_3x_1 \oplus x_3 \oplus x_2x_1 \oplus x_2 \oplus x_1 \oplus x_0, \\ y_2 = x_4x_3 \oplus x_4 \oplus x_2 \oplus x_1 \oplus 1, \\ y_3 = x_4x_0 \oplus x_4 \oplus x_3x_0 \oplus x_3 \oplus x_2 \oplus x_1 \oplus x_0, \\ y_4 = x_4x_1 \oplus x_4 \oplus x_3 \oplus x_1x_0 \oplus x_1. \end{array} \right.$$

- 5 independent linear functions for each line (64-bit word).

$$\left\{ \begin{array}{l} X_0 \leftarrow \Sigma_0(X_0) = X_0 \oplus (X_0 \ggg 19) \oplus (X_0 \ggg 28), \\ X_1 \leftarrow \Sigma_1(X_1) = X_1 \oplus (X_1 \ggg 61) \oplus (X_1 \ggg 39), \\ X_2 \leftarrow \Sigma_2(X_2) = X_2 \oplus (X_2 \ggg 1) \oplus (X_2 \ggg 6), \\ X_3 \leftarrow \Sigma_3(X_3) = X_3 \oplus (X_3 \ggg 10) \oplus (X_3 \ggg 17), \\ X_4 \leftarrow \Sigma_4(X_4) = X_4 \oplus (X_4 \ggg 7) \oplus (X_4 \ggg 41). \end{array} \right.$$

Notations

Table: Notations

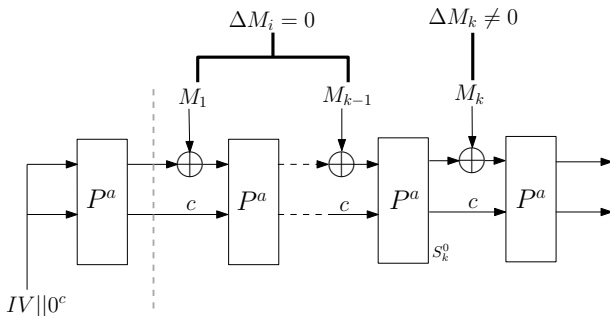

r	the length of the rate part for ASCON-HASH, $r = 64$
c	the length of the capacity part for ASCON-HASH, $c = 256$
S_j^i	the input state of round i when absorbing the message block M_j
$S^i[j]$	the j -th word (64-bit) of S_i
$S^i[j][k]$	the k -th bit of $S^i[j]$, $k = 0$ means the least significant bit and k is within modulo 64
x_i	the i -th bit of a 5-bit value x , x_0 represents the most significant bit
M	message
M_i	the i -th block of the padded message
\ggg	right rotation (circular right shift)
$a \% b$	$a \bmod b$
0^n	a string of n zeroes

Basic Attack Strategy for Sponge-based Hash Functions

- Requirements for differential characteristic:
 - For input difference, only non-zero difference in rate part.
 - For output difference, the same as above.
 - Active S-boxes should be as few as possible in the whole characteristic.

General 2-step attack framework.

- Suppose that there are n_c bit conditions on the capacity part of S_k^0 and the remaining conditions hold with probability 2^{-n_k} .
 - Step1: Find a solution of (M_1, \dots, M_{k-1}) such that the n_c bit conditions on the capacity part of S_k^0 can hold.
 - Step2: Exhaust M_k and check whether remaining n_k bit conditions can hold. If there is a solution, a collision is found. Otherwise, return to Step 1.

General 3-step attack strategy

- Main idea: Further convert the n_c conditions on the capacity part of S_k^0 into some n_c^1 conditions on the capacity part of S_{k-1}^0 .

General 3-step attack strategy

- Step 1: Find a solution of (M_1, \dots, M_{k-2}) such that the n_c^1 bit conditions on the capacity part of S_{k-1}^0 can hold.
- Step 2: Enumerate all the solutions of M_{k-1} such that the conditions on the capacity part of S_k^0 can hold.
- Step 3: Exhaust M_k and check whether remaining n_k bit conditions can hold. If there is a solution, a collision is found. Otherwise, return to Step 1.

Time complexity estimation

■ The time complexity of Step 1, 2 and 3 is denoted by T_{pre1} , T_{k-1} and T_k .

■ The general complexity estimation:

$$T_{\text{total}} = (k-2) \cdot 2^{n_k+n_c-2r} \cdot T_{\text{pre1}} + 2^{n_k+n_c-2r} \cdot T_{k-1} + 2^{n_k-r} \cdot T_k.$$

■ To optimize T_{pre1} as $T_{\text{pre1}} = 2^{n'_c}$, we can significantly improve this complexity as below, where n'_c refers to the number of a part of conditions on S_{k-1}^0 .

$$T_{\text{total}} = (k-2) \cdot 2^{n_k+n_c+n'_c-2r} + 2^{n_k+n_c-2r} \cdot T_{k-1} + 2^{n_k-r} \cdot T_k.$$

Algebraic properties of the S-box

■ With special input and output differences, we can get some linear conditions from the ANF of the S-box.

$$\left\{ \begin{array}{l} y_0 = x_4x_1 \oplus x_3 \oplus x_2x_1 \oplus x_2 \oplus x_1x_0 \oplus x_1 \oplus x_0, \\ y_1 = x_4 \oplus x_3x_2 \oplus x_3x_1 \oplus x_3 \oplus x_2x_1 \oplus x_2 \oplus x_1 \oplus x_0, \\ y_2 = x_4x_3 \oplus x_4 \oplus x_2 \oplus x_1 \oplus \mathbf{1}, \\ y_3 = x_4x_0 \oplus x_4 \oplus x_3x_0 \oplus x_3 \oplus x_2 \oplus x_1 \oplus x_0, \\ y_4 = x_4x_1 \oplus x_4 \oplus x_3 \oplus x_1x_0 \oplus x_1. \end{array} \right.$$

Algebraic properties of the S-box

Property 1 For an input difference $(\Delta_0, \dots, \Delta_4)$ satisfying $\Delta_{x_1} = \Delta_{x_2} = \Delta_{x_3} = \Delta_{x_4} = 0$ and $\Delta_{x_0} = 1$, the following constraints hold:

- For the output difference:

$$\begin{cases} \Delta y_0 \oplus \Delta y_4 = 1, \\ \Delta y_1 = \Delta x_0, \\ \Delta y_2 = 0. \end{cases} \quad (1)$$

- For the input value:

$$\begin{aligned} x_1 &= \Delta y_0 \oplus 1, \\ x_3 \oplus x_4 &= \Delta y_3 \oplus 1. \end{aligned} \quad (2)$$

Algebraic properties of the S-box

Table: The 2-round differential characteristic.

$\Delta S^0 (2^{-54})$	$\Delta S^1 (2^{-102})$	ΔS^2
0xbb450325d90b1581	0x2201080000011080	0xbaf571d85e1153d7
0x0	0x2adf0c201225338a	0x0
0x0	0x0	0x0
0x0	0x0000000100408000	0x0
0x0	0x2adf0c211265b38a	0x0

■ Note:

- S^0 : 27 bit conditions on $S^0[1]$ and 27 on $S^0[3] \oplus S^0[4]$.
- S^1 : 21 bit conditions on $S^1[2]$.

Algebraic properties of the S-box

■ Carefully, after the capacity part of S_3^0 is fixed, $S^1[2]$ is independent to $S^0[0]$ since

$$y_2 = x_4x_3 \oplus x_4 \oplus x_2 \oplus x_1 \oplus 1.$$

- After calculation, there are 21 such conditions on $S^{[2]}$.
- So apart from the 54 linear conditions on the capacity part of S^0 , it needs to add 21 nonlinear conditions on it.
- As a result, the linear conditions on S^2 reduced to 81.

Optimize Exhausting M_3

Now we don't need to exhaust message pairs (M_3, M'_3) . With 81 linear conditions, we can establish 81 linear equations for M_3 .

Property 2

For $(y_0, \dots, y_4) = \text{SB}(x_0, \dots, x_4)$, if $x_3 \oplus x_4 = 1$, y_3 will be independent to x_0 .

Proof.

We can rewrite y_3 as follows:

$$y_3 = (x_4 \oplus x_3 \oplus 1)x_0 \oplus (x_4 \oplus x_3 \oplus x_2 \oplus x_1).$$

Hence, if $x_3 \oplus x_4 = 1$, y_3 is irrelevant to x_0 . □

Property 3

Let

$$(S^1[0], \dots, S^1[4]) = f(S^0[0], \dots, S^0[4]),$$

$$(S^2[0], \dots, S^2[4]) = f(S^1[0], \dots, S^1[4]),$$

where $(S^0[1], S^0[2], S^0[3], S^0[4])$ are constants and $S^0[0]$ is the only variable. Then, it is always possible to make u bits of $S^2[1]$ linear in $S^0[0]$ by adding at most $9u$ bit conditions on $S^0[3] \oplus S^0[4]$.

Property 4

Let

$$\begin{aligned}(S^1[0], \dots, S^1[4]) &= f(S^0[0], \dots, S^0[4]), \\ (S^2[0], \dots, S^2[4]) &= f(S^1[0], \dots, S^1[4]),\end{aligned}$$

where $(S^0[1], S^0[2], S^0[3], S^0[4])$ are constants and $S^0[0]$ is the only variable. Then, it is always possible to make u bits of $S^2[1]$ linear in $S^0[0]$ by guessing $3u$ linear equations in $S^0[0]$.

The Framework of Improving the Attack

- Assume that the capacity part of S_2^0 is known.
 - 1 Add $9u_1$ conditions on the capacity part of $S_2^0 \implies u_1$ bits of $S_3^0[1]$ can be linear in M_2 .
 - 2 Guess $3u_2$ linear equations in $M_2 \implies u_2$ bits of $S_3^0[1]$ can be linear in M_2 .
 - 3 Set up $u_1 + 4u_2$ linear equations in 64 variables to satisfy $u_1 + u_2$ out of 27 bit conditions.
 - 4 Apply Gaussian elimination on these $u_1 + 4u_2$ linear equations and obtain

$$u_3 = 64 - u_1 - 4u_2$$

free variables.

Improve Exhausting M_2

- 1 Guess $3u_2 = 42$ bits of M_2 and construct $4u_2 + u_1$ linear equations.
- 2 Apply the Gaussian elimination to the system and obtain $u_3 = 64 - u_1 - 4u_2$ free variables.
- 3 Construct $54 - u_1 - u_2$ quadratic equations in these u_3 variables and solve the equations.
- 4 Check whether the remaining 21 quadratic conditions on the capacity part of S_3^0 can hold for each obtained solution.

The Optimal Guessing Strategy

- Assume that one round of the ASCON permutation takes about $15 \times 64 \approx 2^{10}$ bit operations
- The optimal choice of (u_1, u_2, u_3) is as follows:

$$u_1 = 3, \quad u_2 = 13 \quad u_3 = 9.$$

- The total time complexity can be estimated as

$$T_{\text{total}} = 2^{28} \times 2^{27} + 2^{28} \times 2^{56.6-11} + 2^{17} \times 2^{19-11} \approx 2^{73.6}$$

calls to the 2-round ASCON permutation.

Further Improving.

- The core problem is to make

$$(S_2^1[3][i], S_2^1[3][i + 61], S_2^1[3][i + 39])$$

constant by either guessing their values or adding bit conditions on $S_2^0[3] \oplus S_2^0[4]$.

So for the same conditional bit, we can use a hybrid guessing strategy.

Further Improving

- Add u_4 conditions on $S_2^0[3] \oplus S_2^0[4]$ and guess u_5 bits of $S_2^1[3]$.
- Set up u_6 linear equations for u_6 conditional bits of $S_2^2[1]$.
- We have in total $u_5 + u_6$ linear equations.
- After the Gaussian elimination, we can set up $54 - u_6$ quadratic equations in $u_7 = 64 - u_5 - u_6$ free variables.

Result: We propose to choose

$$u_4 = 31, \quad u_5 = 28, \quad u_6 = 27$$

The new total time complexity is

$$T_{\text{total}} = 2^{28} \times 2^{31} + 2^{28} \times 2^{28} \times (2^{17.6} + 2^{15.3}) \times 2^{-11} + 2^{17} \times 2^{19-11} \approx 2^{62.6}$$

hash function calls.

4-Round Semi-free-start Attack

- Using the same analysis method to find the conditions of the 4-round differential characteristic.
- Add all linear conditions into STP solver.
- Find a result in 2 minutes.

Conclusion and Future work

- The attack complexity is reduced from 2^{103} to $2^{62.6}$ hash function calls.
- The complexity of the attack is greatly related to the differential characteristic.
- Finding the better characteristic and make the time complexity more practical will be taken as our future work.
