

Single trace HQC shared key recovery with SASCA

Fifth NIST PQC Standardization Conference

Guillaume Goy^{1,2} Julien Maillard ^{1,2} Philippe Gaborit¹ Antoine Loiseau²

¹XLIM, University of Limoges, France

²CEA-LETI, Grenoble Alpes University, France

10 April 2024

Table of Contents

- 1 Soft Analytical Side-Channel Attacks
- 2 Hamming Quasi-Cyclic
- 3 Belief Propagation against HQC (Our attacks)
 - Breaking shuffling countermeasures
 - Breaking high order masking countermeasure
- 4 Exploiting re-encryption step
- 5 Countermeasures
- 6 Conclusion and Perspectives

Table of Contents

- 1 Soft Analytical Side-Channel Attacks
- 2 Hamming Quasi-Cyclic
- 3 Belief Propagation against HQC (Our attacks)
 - Breaking shuffling countermeasures
 - Breaking high order masking countermeasure
- 4 Exploiting re-encryption step
- 5 Countermeasures
- 6 Conclusion and Perspectives

Soft Analytical Side-Channel Attacks (SASCA)

Idea : combine several weak physical leaks to obtain strong information

- Introduced by Veyrat-Chravrillon et al. [VCGS14] to attack AES in 2014
- Application against Kyber [PPM17, PP19, HHP⁺21, HSST23, AEVR23]
→ Information Propagation through NTT

Soft Analytical Side-Channel Attacks (SASCA)

Idea : combine several weak physical leaks to obtain strong information

- Introduced by Veyrat-Chravrillon et al. [VCGS14] to attack AES in 2014
- Application against Kyber [PPM17, PP19, HHP⁺21, HSST23, AEVR23]
→ Information Propagation through NTT
- Attack against hash function Keccak [KPP20] in 2020
- **First attack against code-based cryptography** [GMGL23]

→ Mainly based on **Belief Propagation** [Mac03, KFL01].

Message passing with Belief Propagation

The goal of Belief Propagation is to compute a **Marginal Distribution** for every **Intermediate values** involved in a given algorithm.

Toy Example : Galois Field Multiplication $v = a \times b (= \alpha^{\log(a)+\log(b)})$:

Figure – Graphical representation of a Galois Field Multiplication

Message passing with Belief Propagation

The goal of Belief Propagation is to compute a **Marginal Distribution** for every **Intermediate values** involved in a given algorithm.

Toy Example : Galois Field Multiplication $v = a \times b (= \alpha^{\log(a)+\log(b)})$:

Figure – Graphical representation of a Galois Field Multiplication

The Goal is to compute : $\mathbb{P}(a | b, v), \mathbb{P}(b | a, v), \mathbb{P}(v | a, b)$

Message passing with Belief Propagation

The goal of Belief Propagation is to compute a **Marginal Distribution** for every **Intermediate values** involved in a given algorithm.

Toy Example : Galois Field Multiplication $v = a \times b (= \alpha^{\log(a)+\log(b)})$:

Figure – Graphical representation of a Galois Field Multiplication

The Goal is to compute : $\mathbb{P}(a | b, v)$, $\mathbb{P}(b | a, v)$, $\mathbb{P}(v | a, b)$

Sum Product Algorithm [KFL01] gives a solver for this problem.

Table of Contents

- 1 Soft Analytical Side-Channel Attacks
- 2 Hamming Quasi-Cyclic
- 3 Belief Propagation against HQC (Our attacks)
 - Breaking shuffling countermeasures
 - Breaking high order masking countermeasure
- 4 Exploiting re-encryption step
- 5 Countermeasures
- 6 Conclusion and Perspectives

Hamming Quasi-Cyclic

Algorithm Keygen

Input : param

Output : (pk, sk)

- 1: $\mathbf{h} \xleftarrow{\$} \mathcal{R}$
 - 2: $(\mathbf{x}, \mathbf{y}) \xleftarrow{\$} \mathcal{R}_{\omega}^2$
 - 3: $\mathbf{s} = \mathbf{x} + \mathbf{h}\mathbf{y}$
 - 4: $\text{pk} = (\mathbf{h}, \mathbf{s})$
 - 5: $\text{sk} = (\mathbf{x}, \mathbf{y})$
-

Algorithm Encrypt

Input : (pk, $\mathbf{m} \in \mathbb{F}_2^\lambda$)

Output : ciphertext ct

- 1: $\mathbf{e} \xleftarrow{\$} \mathcal{R}_{\omega_e}$
 - 2: $(\mathbf{r}_1, \mathbf{r}_2) \xleftarrow{\$} \mathcal{R}_{\omega_r}^2$
 - 3: $\mathbf{u} = \mathbf{r}_1 + \mathbf{h}\mathbf{r}_2$
 - 4: $\mathbf{c} = \text{Encode}(\mathbf{m})$
 - 5: $\mathbf{v} = \mathbf{c} + \mathbf{s}\mathbf{r}_2 + \mathbf{e}$
 - 6: $\text{ct} = (\mathbf{u}, \mathbf{v})$
-

Algorithm Decrypt

Input : (sk, ct)

Output : \mathbf{m}'

- 1: $\mathbf{c} + \mathbf{e}' = \mathbf{v} - \mathbf{u}\mathbf{y}$
 - 2: $\mathbf{m}' = \text{Decode}(\mathbf{c} + \mathbf{e}')$
-

Hamming Quasi-Cyclic

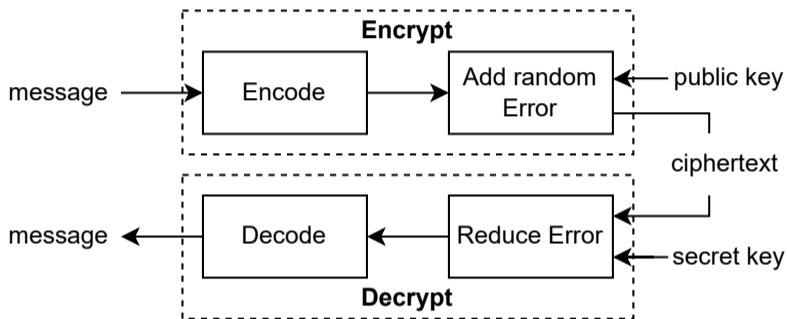

Figure – Hamming Quasi-Cyclic Overview

- Decryption Failure Rate (DFR) is ensured by the error correction capability and analysis of the hamming weight distribution of the error e' [AGZ20]
- Most of the Side-Channel Attacks against HQC target the **decoding step**.

Concatenated code structure

Figure – HQC Concatenated codes structure

Concatenated code structure

Figure – HQC Concatenated codes structure

- (i) **Secret key** recovery attacks : [SHR⁺22, GLG22a, BMG⁺24]
- (ii) **Shared key** (message) recovery attacks : [GLG22b, GMGL23, BMG⁺24]

Reed-Solomon Syndrome Computation

Algorithm Compute Syndromes from HQC RS Decoder from [AMAB⁺23]

Require: parameters : k, n the dimension and length of the code

Require: parity check matrix $H \in \mathbb{F}_q^{(n-k, n)}$

Require: codeword $c \in \mathbb{F}_q^{n_1}$

Ensure: $s := H^T \times c$ the syndrome of c

1: Initialize s to 0^{n-k}

2: **for** i from 0 to $n - k$ **do**

3: **for** j from 1 to n **do**

4: $s[i] = s[i] \oplus c[j] \times H[i, j - 1]$

▷ \times is the Galois Field multiplication

5: $s[i] = s[i] \oplus c[0]$

Table of Contents

- 1 Soft Analytical Side-Channel Attacks
- 2 Hamming Quasi-Cyclic
- 3 Belief Propagation against HQC (Our attacks)**
 - Breaking shuffling countermeasures
 - Breaking high order masking countermeasure
- 4 Exploiting re-encryption step
- 5 Countermeasures
- 6 Conclusion and Perspectives

Templates on the Galois field multiplication operands

Galois field multiplication based on FFT strategy [BGTZ08]

Templates on the Galois field multiplication operands

Galois field multiplication based on FFT strategy [BGTZ08]

	Value template accuracy	Hamming weight template accuracy
Input 1	0.9389	0.5929
Input 2	0.0211	0.3035
Output	0.0221	0.5178

Table – Hamming weight and value templates accuracies on `gf_mu1`. Each attack has been performed 400 times. 10%/90% validation/training segmentation.

Outer Decoder syndrome computation graphical representation

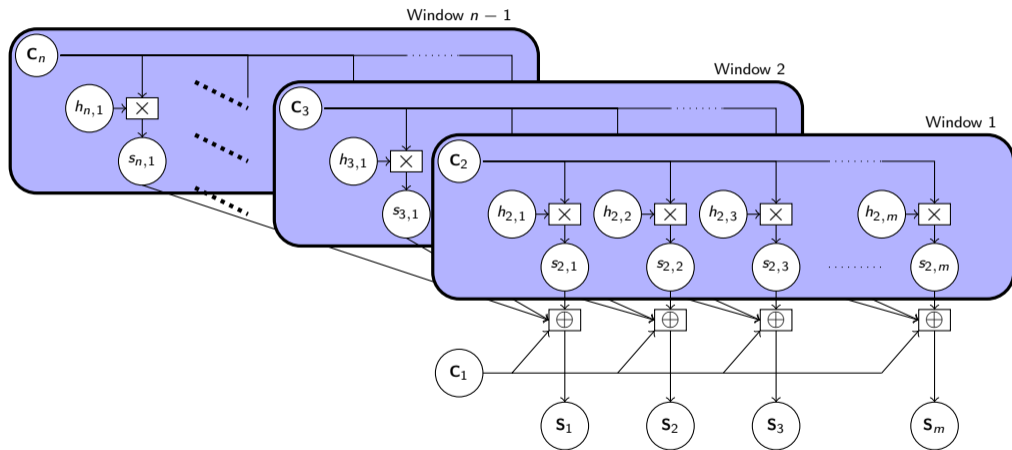

Figure – Graphical representation of the RS syndrome computation from HQC

Re-decoding Strategy

Security level	HQC parameters			List decoder
λ	k_1	n_1	t	τ_{GS}
HQC-128	16	46	15	19
HQC-192	24	56	16	19
HQC-256	32	90	29	36

Table – Reed-Solomon error correction capability of the RS decoder for each HQC set of parameters, given for a classical decoder and the Guruswami-Sudan list decoder.

Attack Accuracy in Simulation

Figure – Simulated success rate of SASCA on the decoder, with re-decoding strategy, depending on the selected security level of HQC

Breaking shuffling countermeasures

- Fine Shuffling (Adapted from a Kyber countermeasure)
 - Randomly choose $a \times b$ or $b \times a$.
- Coarse shuffling (Adapted from a Kyber countermeasure)
 - Randomly shuffle columns of the parity check matrix
- Window Shuffling (Novelty)
 - Randomly shuffle lines of the parity check matrix

$$D[i, i'] = \sum_{j=1}^{256} d(\tilde{T}[i, j], T[i', j])$$

Instance of the assignment Problem.

→ Solver : Hungarian algorithm.

Breaking Codeword Masking (High Level Masking)

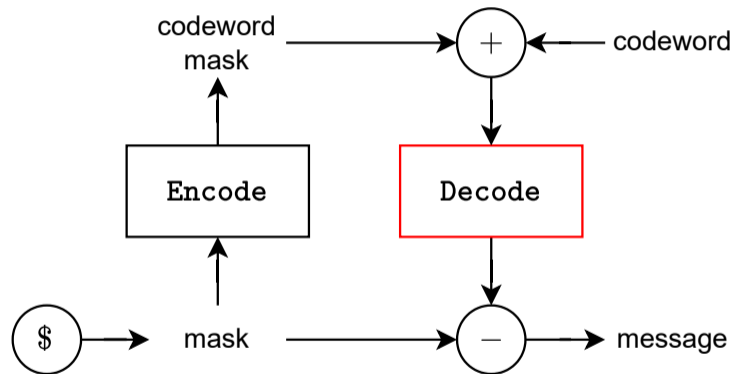

Figure – High level Masking of a decoder (Codeword Masking) [MSS13]

Encoder Attack Accuracy in Simulation

Figure – Simulated success rate of SASCA on the decoder, with re-decoding strategy, depending on the selected security level of HQC

Table of Contents

- 1 Soft Analytical Side-Channel Attacks
- 2 Hamming Quasi-Cyclic
- 3 Belief Propagation against HQC (Our attacks)
 - Breaking shuffling countermeasures
 - Breaking high order masking countermeasure
- 4 Exploiting re-encryption step
- 5 Countermeasures
- 6 Conclusion and Perspectives

re-encryption step from HHK transform

- HQC-KEM is based on HHK transform [HHK17]
- This transform introduces a re-encryption step.

re-encryption step from HHK transform

- HQC-KEM is based on HHK transform [HHK17]
- This transform introduces a re-encryption step.

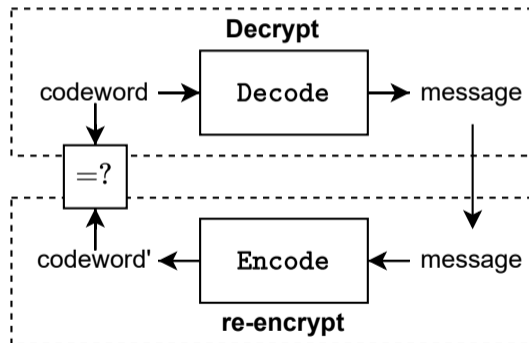

Figure – HQC Structure with HHK transform

FO Attack Accuracy in Simulation

Decoder

Encoder

Figure – Simulated success rate of SASCA on the decoder and encoder exploiting re-encryption

Table of Contents

- 1 Soft Analytical Side-Channel Attacks
- 2 Hamming Quasi-Cyclic
- 3 Belief Propagation against HQC (Our attacks)
 - Breaking shuffling countermeasures
 - Breaking high order masking countermeasure
- 4 Exploiting re-encryption step
- 5 Countermeasures**
- 6 Conclusion and Perspectives

Full Shuffling Countermeasure

- The idea is to shuffle the entire matrix, instead of only rows or columns, during the matrix vector multiplication.
 - Even if an attacker exactly recover the shuffled matrix, there exists 2^{504} , 2^{614} and 2^{1030} different permutations for the three security levels respectively.

Full Shuffling Countermeasure

- The idea is to shuffle the entire matrix, instead of only rows or columns, during the matrix vector multiplication.
 - Even if an attacker exactly recover the shuffled matrix, there exists 2^{504} , 2^{614} and 2^{1030} different permutations for the three security levels respectively.
- The encoder could be change to a classical multiplication with a generator matrix to benefit from the same countermeasure.

Table of Contents

- 1 Soft Analytical Side-Channel Attacks
- 2 Hamming Quasi-Cyclic
- 3 Belief Propagation against HQC (Our attacks)
 - Breaking shuffling countermeasures
 - Breaking high order masking countermeasure
- 4 Exploiting re-encryption step
- 5 Countermeasures
- 6 Conclusion and Perspectives

Conclusion and Perspectives

Conclusions

- Soft analytical side-channel attacks are a threat for (code-based) cryptography.
- Efficient countermeasure against these attacks are required.

Conclusion and Perspectives

Conclusions

- Soft analytical side-channel attacks are a threat for (code-based) cryptography.
- Efficient countermeasure against these attacks are required.

Future Works

- Target other code-based schemes with Belief Propagation Algorithms.
- Secure HQC against side-channel attacks in the t -probing model.

Conclusion and Perspectives

Conclusions

- Soft analytical side-channel attacks are a threat for (code-based) cryptography.
- Efficient countermeasure against these attacks are required.

Future Works

- Target other code-based schemes with Belief Propagation Algorithms.
- Secure HQC against side-channel attacks in the t -probing model.

Thank you for your attention !
