## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

### 1 Introduction

This document defines the Security Policy for the Gemalto IDCore30 platform and the ID Prime MD applet (IAS Classic V4.1) card called IDPrime MD 830 and herein denoted as Cryptographic Module. The Cryptographic Module or CM, validated to FIPS 140-2 overall Level 3, is a “contact-only” secure controller module implementing the Global Platform operational environment, with Card Manager, the IDPrime MD applet (associated to MSPNP applet V1.0).

The CM is a limited operational environment under the FIPS 140-2 definitions. The CM includes a firmware load service to support necessary updates. New firmware versions within the scope of this validation must be validated through the FIPS 140-2 CMVP. Any other firmware loaded into this module is out of the scope of this validation and requires a separate FIPS 140-2 validation.

The FIPS 140-2 security levels for the Module are as follows:

| Security Requirement                      | Security Level |
|---|----------------|
| Cryptographic Module Specification        | 3              |
| Cryptographic Module Ports and Interfaces | 3              |
| Roles, Services, and Authentication       | 3              |
| Finite State Model                        | 3              |
| Physical Security                         | 3              |
| Operational Environment                   | N/A            |
| Cryptographic Key Management              | 3              |
| EMI/EMC                                   | 3              |
| Self-Tests                                | 3              |
| Design Assurance                          | 3              |
| Mitigation of Other Attacks               | 3              |

**Table 3 – Security Level of Security Requirements**

The CM implementation is compliant with:

- [ISO 7816] Parts 1-4
- [JavaCard]
- [GlobalPlatform]

#### 1.1 IDPrime MD Applet

IDPrime MD Applet (called IAS Classic V4.1) is a Java applet that provides all the necessary functions to integrate a smart card in a public key infrastructure (PKI) system, suitable for identity and corporate

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

security applications. It is also useful for storing information about the cardholder and any sensitive data. IDPrime MD Applet implements state-of-the-art security and conforms to the latest standards for smart cards and PKI applications. It is also fully compliant with digital signature law.

The IDPrime MD Applet, designed for use on JavaCard 2.2.2 and Global Platform 2.1.1 compliant smart cards.

The main features of IDPrime MD Applet are as follows:

- Digital signatures—these are used to ensure the integrity and authenticity of a message. (RSA, ECDSA)
- Storage of sensitive data based on security attributes
- PIN management.
- Secure messaging based on the triple DES (3DES2) and AES algorithms.
- Public key cryptography, allowing for RSA keys and ECDSA keys
- Storage of digital certificates—these are issued by a trusted body known as a certification authority (CA) and are typically used in PKI authentication schemes.
- CVC verification
- Decryption RSA , ECDH
- On board key generation (RSA, ECDSA)
- Mutual authentication between IDPrime MD Applet and the terminal (Triple-DES, AES, RSA, ECDH)
- Support of integrity on data to be signed.
- Secure Key Injection according to Microsoft scheme.

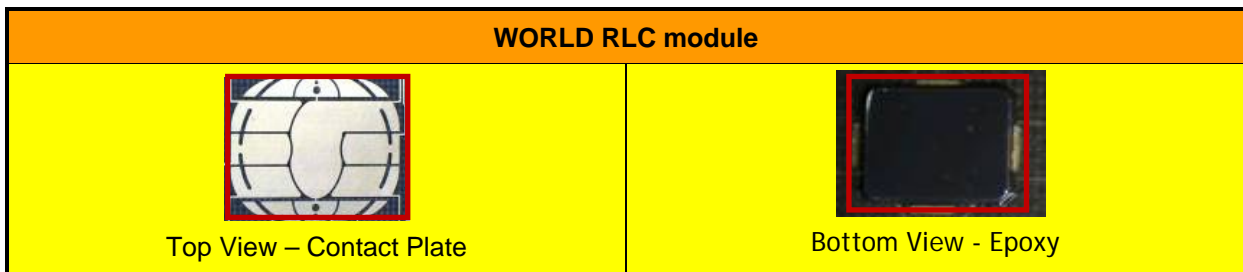

MSPNP applet is associated to IDPrime MD applet and offers:

- GUID tag reading, defined in Microsoft Mini Driver specification.

## 2 Cryptographic Module Ports and Interfaces

### 2.1 Hardware and Physical Cryptographic Boundary

The CM is designed to be embedded into plastic card bodies, with a contact plate connection. The physical form of the CM is depicted in Figure 1 (to scale), with the cryptographic boundary indicated by the red outline. The module is a single integrated circuit die wire-bonded to a frame connected to a contact plate, enclosed in epoxy and mounted in a card body. The cryptographic boundary is the contact plate surface on the top side, and the surface of the epoxy on the bottom side. The Module relies on [ISO7816] card readers as input/output devices.

**Figure 1 – Contact module views**

#### 2.1.1 PIN assignments and contact dimensions

The CM conforms to the ISO 7816-1 and ISO 7816-2 specifications for physical characteristics, dimensions and contact location. The contact plate pads are assigned as shown below, with the corresponding interfaces given in Table 4.

**Figure 2 – Contact plate example – Contact physical interface**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

| Contact No. | Logical interface type | Contact No. | Logical interface type                          |
|-------------|------------------------|-------------|---|
| C1          | VCC (Supply voltage)   | C5          | GND (Ground)                                    |
| C2          | RST (Reset signal)     | C6          | Not connected                                   |
| C3          | CLK (Clock signal)     | C7          | I/O : Data in, data out, control in, status out |
| C4          | Not connected          | C8          | Not connected                                   |

**Table 4 - Contact plate pad list – Interfaces**

The CM conforms to the ISO 7816-3 specifications for electrical signals and transmission protocols, with voltage and frequency operating ranges as shown in Table 5.

| Conditions | Range            |
|------------|------------------|
| Voltage    | 1.62 V and 5.5 V |
| Frequency  | 1MHz to 10MHz    |

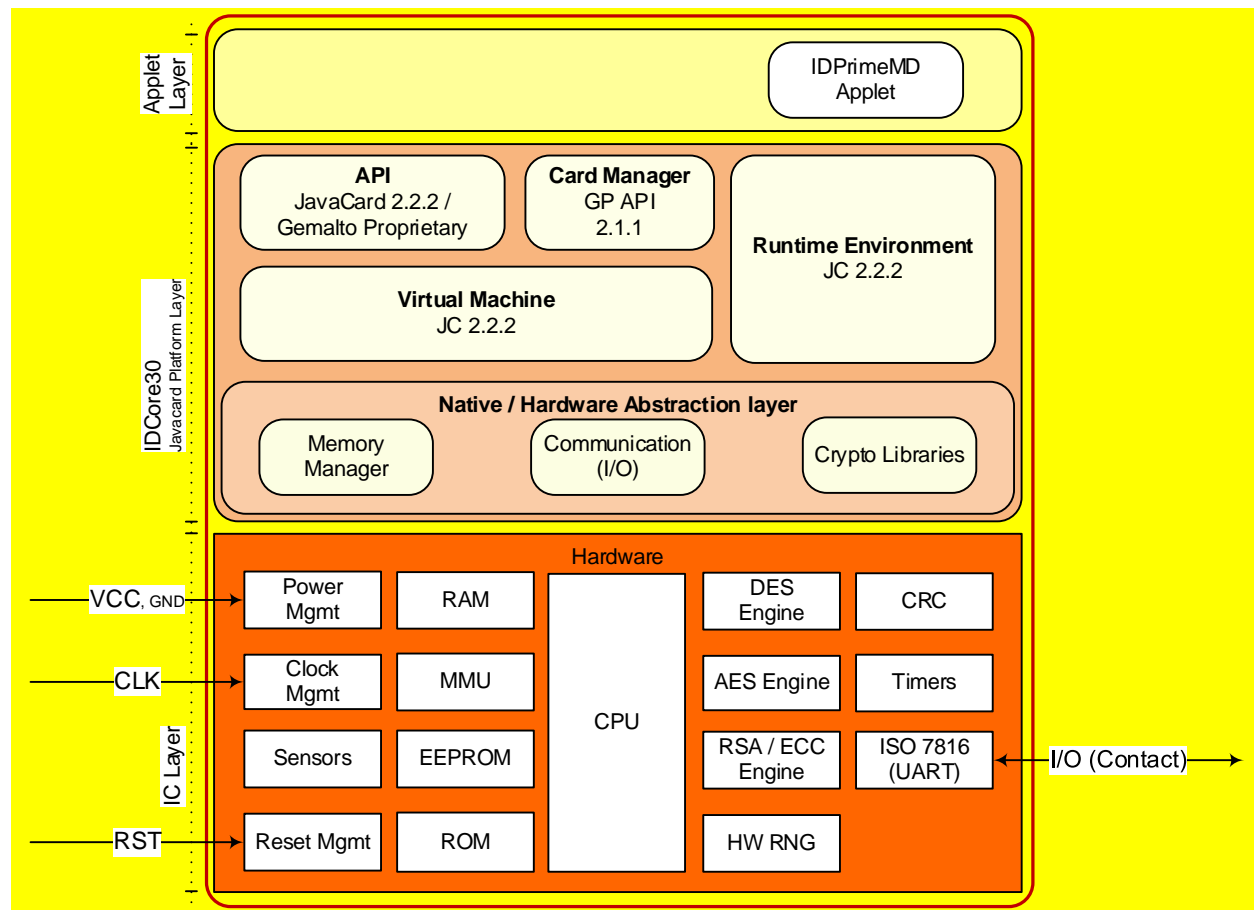

**Table 5 - Voltage and frequency ranges**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

### 3 Cryptographic Module Specification

#### 3.1 Firmware and Logical Cryptographic Boundary

Figure below depicts the Module operational environment and applets.

**Figure 3 - Module Block Diagram**

The CM supports [ISO7816] T=0 and T=1 communication protocols.

The CM provides services to both external devices and internal applets as the IDPrime MD.

Applets, as IDPrime MD, access module functionalities via internal API entry points that are not exposed to external entities. External devices have access to CM services by sending APDU commands.

The CM provides an **execution sandbox for the IDPrime MD Applet** and performs the requested services according to its roles and services security policy.

The CM inhibits all data output via the data output interface while the module is in error state and during self-tests.

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

The *JavaCard API* is an internal interface, available to applets. Only applet services are available at the card edge (the interfaces that cross the cryptographic boundary).

The *Javacard Runtime Environment* implements the dispatcher, registry, loader, logical channel and RMI functionalities.

The *Virtual Machine* implements the byte code interpreter, firewall, exception management and byte code optimizer functionalities.

The *Card Manager* is the card administration entity – allowing authorized users to manage the card content, keys, and life cycle states.

The *Memory Manager* implements services such as memory access, allocation, deletion, garbage collector.

The *Communication* handler deals with the implementation of ATR, PSS, T=0 and T=1 protocols.

The *Cryptography Libraries* implement the algorithms listed in section 2.

### 3.2 Versions and mode of operation

**Hardware:** SLE78CFX3009P

**Firmware:** IDCore30 Build 1.17, IDPrime MD Applet version V4.1.2.F and MSPNP Applet V1.0

The CM is always in the approved mode of operation. To verify that a CM is in the approved mode of operation, select the Card Manager and send the GET DATA commands shown below:

| Field | CLA | INS | P1-P2 (Tag) | Le (Expected response length) | Purpose                                      |
|-------|-----|-----|-------------|-------------------------------|--|
| Value | 00  | CA  | 9F-7F       | 2A                            | Get CPLC data                                |
|       |     |     | 01-03       | 1D                            | Identification information (proprietary tag) |

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

The CM responds with the following information:

| G259 Mask - CPLC data (tag 9F7F) |   |           |  |
|----------------------------------|---|-----------|--|
| Byte                             | Description   | Value     | Value meaning                              |
| 1-2                              | IC fabricator   | 4090h     | Infineon                                   |

**Table 6 –Versions and Mode of Operations Indicators**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

The IDPrime MD 830 is identified with an applet version and a software version as follow:

| Field | CLA | INS | P1-P2 (Tag) | Le (Expected response length) | Purpose              |
|-------|-----|-----|-------------|-------------------------------|----------------------|
| Value | 00  | CA  | DF-30       | 07                            | Get Applet Version   |
|       |     |     | 7F-30       | 19                            | Get Software Version |

**Table 7 – Applet Version and Software Version input data**

The Applet version is returned without any TLV format as follows:

| IDPrimeMD 830 – Applet Version Data (tag DF30) |   |
|--|---|
| Value  | Value Meaning                               |
| 34 2E 31 2E 32 2E 46                           | Applet Version<br>Display value = '4.1.2.F' |

**Table 8 –Applet Version returned value**

The Software Version is returned in TLV format as follows:

| IDPrimeMD 830 – Software Version Data (tag 7F30) |        |     |        |  |  |
|--|--------|-----|--------|--|--|
| Tag  | Length |     |        |  |  |
| 7F30   | 17     |     |        |  |  |
|  |        | Tag | Length | Value  | Value meaning                                    |
|  |        | C0  | 0E     | 34 2E 31 2E 32 2E 46                         | Software Version<br>Display value = '4.1.2.F'    |

**Table 9 –Software Version returned values**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

### 3.3 Cryptographic functionality

The Module operating system implements the FIPS Approved and Non-FIPS Approved cryptographic function listed in Tables below.

| Algorithm                                 | Description   | Cert # |
|---|---|--------|
| Triple-DES                                | [SP 800-67] Triple Data Encryption Algorithm. The Module supports the 3-Key options; CBC and ECB modes. Note that the Module does not support a mechanism that would allow collection of plaintext / ciphertext pairs aside from authentication, limited in use by a counter. | 1413   |
| Triple -DES MAC                           | [FIPS 113] Triple-DES Message Authentication Code. Vendor affirmed, based on validated Triple-DES.  | 1413   |
| AES                                       | [FIPS 197] Advanced Encryption Standard algorithm. The Module supports 128-, 192- and 256-bit key lengths with ECB and CBC modes.   | 2261   |
| AES CMAC                                  | AES CMAC The Module supports 128-, 192- and 256-bit key lengths.  | 2261   |
| KTS                                       | [SP800-38F] Symmetric Key wrapping using 128, 192, or 256 bit keys (based on AES and AES CMAC Cert. #2261), meets the SP800-38F §3.1 ¶3. Key establishment methodology provides between 128 and 256 bits of encryption strength.  | 2261   |
| RSA                                       | [FIPS 186-3] RSA<br>Signature generation: 2048-bit using SHA-2<br>Signature verification: 1024 and 2048-bit using SHA-1 and SHA-2   | 1158   |
| RSA CRT                                   | [FIPS 186-3] RSA<br>Signature generation: 2048-bit using SHA-2<br>Signature verification: 1024 and 2048-bit using SHA-1 and SHA-2   | 1163   |
| ECDSA                                     | [FIPS 186-3] Elliptic Curve Digital Signature Algorithm:<br>Signature generation: P-224, P-256, P-384 and P-521 curves using SHA-2<br>Signature verification: P-192, P-224, P-256, P-384 and P-521 curves using SHA-1 and SHA-2   | 363    |
| ECC-CDH                                   | [SP 800-56A] The Section 5.7.1.2 ECC CDH Primitive. The Module is CAVP validated for the NIST defined P-224, P-256, P-384 and P-521 curves.   | 41     |
| SHA-1, SHA-224, SHA-256, SHA-384, SHA-512 | [FIPS 180-4] Secure Hash Standard compliant one-way (hash) algorithms.  | 1946   |

**Table 10 – FIPS Approved Cryptographic Functions**

| Algorithm                       | Description  |
|---------------------------------|--|
| RSA key wrap                    | Key wrapping using 2048 bit keys.<br>Key establishment methodology provides 112 bits of encryption strength.   |
| EC Diffie-Hellman key agreement | SP 800-56A; non-compliant - key agreement using NIST defined, P-224, P-256, P-384 and P-521 curves.<br>Key establishment methodology provides between 112 and 256 bits of encryption strength. |

**Table 11 – Non-FIPS Approved But Allowed Cryptographic Functions**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

The CM includes an uncallable DES implementation. This algorithm is not used and no security claims are made for its presence in the Module.

The module implements algorithms, modes and key sizes that are disallowed per the NIST SP 800-131A transitions. Algorithms providing less than 112 bits of security strength (Disallowed per NIST SP 800-131A) are not allowed in the FIPS Approved mode of operation for use by Federal agencies. The Disallowed algorithms, modes and key sizes are listed in the table below.

| Algorithm           | Description   |
|---------------------|---|
| PRNG                | Pseudo Random Number Generation (*)   |
| Triple-DES          | 2-key ECB mode in encryption (*)  |
|                     | 2-key CBC mode in encryption (*)  |
| Triple-DES MAC      | 2-key ECB and CBC modes for generation (*)  |
| RSA                 | [FIPS 186-3] RSA<br>Key pair generation (*) following X9.31.<br>Signature generation following PKCS#1 using 1024 bit key length with any SHA size or 2048 bit key length with SHA-1 hashing (*)           |
| RSA CRT             | [FIPS 186-3] RSA<br>Key pair generation (*) following X9.31.<br>Signature generation following PKCS#1 using 1024 bit key length with any SHA size or 2048 bit key length with SHA-1 hashing (*)           |
| ECDSA               | [FIPS 186-3] Elliptic Curve Digital Signature Algorithm<br>Key pair generation (*)<br>Signature Generation (*) following FIPS186-3 using P-192 with any SHA size or P-224, P-256, P-384, P-521 with SHA-1 |
| ECC-CDH             | [SP 800-56A] The Section 5.7.1.2 ECC CDH Primitive. P-192 curve (*).  |
| RSA key wrap        | RSA key wrapping using 1024-bit keys (*); provides 80 bits of security (non-compliant)  |
| Triple-DES key wrap | 2-key Triple-DES key wrapping (*) (Cert. #1413); provides 80 bits of security (non-compliant)   |

Table 12 - **Non-Approved Functions (Disallowed per NIST SP 800-131A Transitions)**

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

Functions used specifically by the **IDPrime MD Applet** are:

- PRNG (\*)
- Triple-DES (\*)
- Triple-DES MAC (\*)
- AES CMAC
- AES
- RSA (\*)
- ECDSA (\*)
- SHA-1, SHA-224, SHA-256, SHA-384, SHA-512
- ECC-CDH\*

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

(Note: no security function is used in MSPNP applet)

### 4 Platform Critical Security Parameters

All CSPs used by the CM are described in this section. All usages of these CSPs by the CM are described in the services detailed in Section 5.

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

| Key             | Description / Usage  |
|-----------------|--|
| OS-RNG-SEED-KEY | AES-128 random key loaded into the card during pre-personalization of the card used as a seed key for the [ANS X9.31] RNG implementation (*).  |
| OS-RNG-STATE    | 16-byte random value and 16-byte counter value used in the [ANS X9.31] RNG implementation (*).   |
| OS-GLOBALPIN    | 4 to 16 bytes Global PIN value managed by the ISD. Character space is not restricted by the module.  |
| OS-MKDK         | 2-Key Triple-DES (SCP01/02) (*) or AES-128/192/256 (SCP03) key used to encrypt OS-GLOBALPIN value  |
| SD-KENC         | 2-Key Triple-DES (SCP01/02) (*) or AES-128/192/256 (SCP03) Master key used by the CO role to generate SD-SENC  |
| SD-KMAC         | 2-Key Triple-DES (SCP01/02) (*) or AES-128/192/256 (SCP03) Master key used by the CO role operator to generate SD-SMAC   |
| SD-KDEK         | 2-Key Triple-DES (SCP01/02) (*) or AES-128/192/256 (SCP03) Sensitive data decryption key used by the USR role to decrypt CSPs for SCP01/03, and used to generate SD-SDEK in case of SCP02. |
| SD-SENC         | 2-Key Triple-DES (SCP01/02) (*) or AES-128/192/256 (SCP03) Session encryption key used by the CO role to encrypt / decrypt secure channel data.  |
| SD-SMAC         | 2-Key Triple-DES (SCP01/02) (*) or AES-128/192/256 (SCP03) Session MAC key used by the CO role to verify inbound secure channel data integrity.  |
| SD-SDEK         | 2-Key Triple-DES (SCP01) (*) or AES-128/192/256 (SCP03) Session DEK key used by the CO role to decrypt CSPs.   |
| DAP-SYM         | 2-Key Triple-DES (SCP01/02) (*) or AES-128/192/256 (SCP03) key optionally loaded in the field and used to verify the signature of packages loaded into the Module.                         |

**Table 13 - Platform Critical Security Parameters**

Keys with the “SD-“ prefix pertain to a Global Platform Security Domain key set. The module supports the Issuer Security Domain at minimum, and can be configured to support Supplemental Security Domains.

#### 4.1 Platform Public key

| Key     | Description / Usage  |
|---------|--|
| DAP-SVK | RSA 1024 Global Platform Data Authentication Public Key. Optionally used to verify the signature of packages loaded into the Module. |

**Table 14 – Platform Public Keys**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

### 4.2 IDPrime MD Applet Critical Security Parameters

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

| Key                | Description / Usage   |
|--------------------|---|
| IAS-SC-DKMAC-AES   | AES 128/192/256 Derived Key used for Mutual Authentication  |
| IAS-SC-DKENC-AES   | AES 128/192/256 Derived Key used for Mutual Authentication  |
| IAS-SC-DKMAC-TDES  | 2-Key Triple-DES (*) Derived Key used for Mutual Authentication   |
| IAS-SC-DKENC-TDES  | 2-Key Triple-DES (*) Derived Key used for Mutual Authentication   |
| IAS-SC-SMAC-AES    | AES 128/192/256 Session key used for Secure Messaging (MAC)   |
| IAS-SC-SENC-AES    | AES 128/192/256 Session key used for Secure Messaging (Decryption)  |
| IAS-SC-SMAC-TDES   | 2-Key Triple-DES (*) Session key used for Secure Messaging (MAC)  |
| IAS-SC-SENC-TDES   | 2-Key Triple-DES (*) Session key used for Secure Messaging (Decryption)                                       |
| IAS-AS-RSA         | 1024- (*),2048- private part of the RSA key pair used for Asymmetric Signature                                |
| IAS-AS-ECDSA       | P-224, P-256, P-384, P-512, P-521 private part of the ECDSA key pair used for Asymmetric signature            |
| IAS-AC-RSA         | 1024- (*), 2048- private part of the RSA key pair used for Asymmetric Cipher (key wrap, key unwrap)           |
| IAS-ECDH-ECC       | P-224, P-256, P-384, P-512, P-521 private part of the ECDH key pair used for shared key mechanism             |
| IAS-KG-AS-RSA      | 1024- (*), 2048- private part of the RSA generated key pair used for Asymmetric signature                     |
| IAS-KG-AS-ECDSA    | P-224, P-256, P-384, P-512, P-521 private part of the ECDSA generated key pair used for Asymmetric signature  |
| IAS-KG-AC-RSA      | 1024- (*), 2048- private part of the RSA generated key pair used for Asymmetric cipher (key wrap, key unwrap) |
| IAS-KG-AC-ECDH     | P-224, P-256, P-384, P-512, P-521 private part of the ECDSA generated key pair used for shared key mechanism  |
| IAS-AS-AUTH-RSA    | 1024- (*), 2048- private part of the RSA key pair used to Authenticate the Card                               |
| IAS-ECDSA-AUTH-ECC | P-224, P-256, P-384, P-512, P-521 private part of the ECDSA private key used to Authenticate the card         |
| IAS-SC-DES3        | 3-Key Triple-DES key used for authentication.   |
| IAS-SC-P-SKI-AES   | AES 128/192/256 Session key used for Secure Key Injection   |

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

| Key              | Description / Usage  |
|------------------|--|
| IAS-SC-T-SKI-AES | AES 128/192/256 Session key used for Secure Key Injection      |
| IAS-SC-PIN-TDES  | 2-Key Triple-DES key (*) used for PIN encryption (PIN History) |
| IAS-OWNERPIN     | 4 to 64 byte PIN value managed by the Applet.                  |

**Table 15 – IDPrime MD Applet Critical Security Parameters**

### 4.3 IDPrime MD Applet Public Keys

| Key                    | Description / Usage  |
|------------------------|--|
| IAS-KA-RSA-DH          | 1024-, 2048- RSA DH key used for Key Agreement (Session Key computation)   |
| IAS-KA-ECDH            | P-224, P-256, P-384, P-512, P-521 ECDH key pair used for Key Agreement (Session Key computation)                               |
| IASAS-CA-RSA-PUB       | 1024-, 2048- CA RSA Asymmetric Public Key entered into the module used for CA certificate Verification                         |
| IASAS-CA-ECDSA-PUB     | P-224, P-256, P-384, P-512, P-521 CA ECDSA Asymmetric public key entered into the module used for CA Certificate Verification. |
| IASAS-IFD-RSA-PUB      | 1024-, 2048- IFD RSA Asymmetric Public Key entered into the module used for IFD Authentication                                 |
| IASAS-IFD-ECDSA-PUB    | P-224, P-256, P-384, P-512, P-521 IFD ECDSA Asymmetric public key entered into the module used for IFD Authentication.         |
| IAS-AS-RSA-PUB         | 1024, 2048- public part of RSA key pair used for Asymmetric Signature  |
| IAS-AS-ECDSA-PUB       | P-224, P-256, P-384, P-512, P-521 public part of ECDSA key pair used for Asymmetric signature                                  |
| IAS-AC-RSA-PUB         | 1024, 2048 public part of the RSA key pair used for Asymmetric Cipher (key wrap, key unwrap)                                   |
| IAS-ECDH-ECC-PUB       | P-224, P-256, P-384, P-512, P-521 public part of the ECDH key pair used for shared key mechanism                               |
| IAS-KG-AS-RSA-PUB      | 1024 (*), 2048- public part of the RSA generated key pair used for Asymmetric signature  |
| IAS-KG-AS-ECDSA-PUB    | P-224, P-256, P-384, P-512, P-521 public part of the ECDSA generated key pair used for Asymmetric signature                    |
| IAS-KG-AC-RSA-PUB      | 1024, 2048- public part of the RSA generated key pair used for Asymmetric cipher (key wrap, key unwrap)                        |
| IAS-KG-AC-ECDH-PUB     | P-224, P-256, P-384, P-512, P-521 public part of the ECDSA generated key pair used for shared key mechanism                    |
| IAS-AS-AUTH-RSA-PUB    | 1024, 2048 public part of the RSA key pair used to Authenticate the Card   |
| IAS-ECDSA-AUTH-ECC-PUB | P-224, P-256, P-384, P-512, P-521 public part of the ECDSA key pair used to Authenticate the card                              |

**Table 16 – IDPrime MD Applet Public Keys**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

### 5 Roles, authentication and services

Next table lists all operator roles supported by the Module. This Module does not support a maintenance role. The Module clears previous authentications on power cycle. The Module supports GP logical channels, allowing multiple concurrent operators. Authentication of each operator and their access to roles and services is as described in this section, independent of logical channel usage. Only one operator at a time is permitted on a channel. Applet de-selection (including Card Manager), card reset or power down terminates the current authentication; re-authentication is required after any of these events for access to authenticated services. Authentication data is encrypted during entry (by SD-SDEK), is stored encrypted (by OS-MKDK) and is only accessible by authenticated services.

| Role ID | Role Description  |
|---------|---|
| CO      | (Cryptographic Officer) This role is responsible for card issuance and management of card data via the Card Manager applet. Authenticated using the SCP authentication method with SD-SENC. |
| IUSR    | (User) The IDPrime MD User, authenticated by the IDPrime MD applet – see below for authentication mechanism.  |
| ICAA    | (Card Application Administrator) The IDPrime MD Card Application Administrator authenticated by the IDPrime MD applet – see below for authentication mechanism.                             |
| UA      | Unauthenticated role  |

**Table 17 - Role description**

#### 5.1 Secure Channel Protocol (SCP) Authentication

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

The Open Platform Secure Channel Protocol authentication method is performed when the EXTERNAL AUTHENTICATE service is invoked after successful execution of the INITIALIZE UPDATE command. These two commands operate as described next.

The SD-KENC and SD-KMAC keys are used along with other information to derive the SD-SENC and SD-SMAC keys, respectively. The SD-SENC key is used to create a cryptogram; the external entity participating in the mutual authentication also creates this cryptogram. Each participant compares the received cryptogram to the calculated cryptogram and if this succeeds, the two participants are mutually authenticated (the external entity is authenticated to the Module in the CO role).

For SCP01 or SCP02 [SP 800-131A] Section A.1 provides the NIST rationale for 2-Key Triple-DES security strength. 2-Key Triple-DES is used for Global Platform secure channel operations, in which the Module derives session keys from the master keys and a handshake process, performs mutual authentication, and decrypts data for internal use only. The Module encrypts a total of one block (the mutual authentication cryptogram) over the life of the session encryption key; no decrypted data is output by the Module.

2-Key Triple-DES key (\*) establishment provides 80 bits of security strength. The Module uses the SD-KDEK key to decrypt critical security parameters, and does not perform encryption with this key or output data decrypted with this key.

- The probability that a random attempt at authentication will succeed is  $1/2^{64}$  (based on block size)
- Based on the maximum count value of the failed authentication blocking mechanism, the probability that a random attempt will succeed over a one minute period is  $255/2^{64}$

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

For SCP03, AES-128, AES-192 or AES-256 keys are used instead of 2-key Triple-DES. Operations are identical to those previously described. Therefore, AES key establishment provides a minimum of 128 bits of security strength. The Module uses the SD-KDEK key to decrypt critical security parameters, and does not perform encryption with this key or output data decrypted with this key.

The strength of GP mutual authentication relies on AES key length:

- $\left(\frac{1}{2^{128}}\right)$  for AES 16-byte-long keys;
- $\left(\frac{1}{2^{192}}\right)$  for AES 24-byte-long keys;
- $\left(\frac{1}{2^{256}}\right)$  for AES 32-byte-long keys;

Based on the maximum count value of the failed authentication blocking mechanism, the minimum probability that a random attempt will succeed over a one minute period is  $255/2^{128}$ .

### 5.2 IDPrime MD User authentication

This authentication method compares a PIN value sent to the Module to the stored PIN values if the two values are equal, the operator is authenticated. This method is used in the IDPrime MD Applet services to authenticate to the IUSR role.

The module enforces string length of 4 bytes minimum (16 bytes maximum) for the Global PIN and 8 bytes for the Session PIN.

For the Global PIN, an embedded PIN Policy allows at least a combination of Numeric value ('30' to '39') or alphabetic upper case ('A' to 'Z') or alphabetic lower case ('a' to 'z'), so the possible combination of value for the Global PIN is greater than  $10^6$ . Then the strength of this authentication method is as follow:

- The probability that a random attempt at authentication will succeed is lower than  $1/10^6$
- Based on a maximum count of 15 for consecutive failed service authentication attempts, the probability that a random attempt will succeed over a one minute period is lower than  $15/10^6$

### 5.3 IDPrime MD Card Application Administrator authentication (ICAA)

- a) **The 3-Key Triple-DES key** establishment provides 168 bits of security strength. The Module uses the IAS-SC-DES3 to authenticate the ICAA role.
  - The probability that a random attempt at authentication will succeed is  $1/2^{64}$  (based on block size)
  - Based on the maximum count value of the failed authentication blocking mechanism, the probability that a random attempt will succeed over a one minute period is  $255/2^{64}$

#### b) PIN authentication

This authentication method compares a PIN value sent to the Module to the stored OWNERPIN values if the two values are equal, the operator is authenticated. This method is used in the IDPrime MD Applet services to authenticate the ICAA role.

The module enforces string length of 4 bytes minimum (64 bytes maximum).

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

An embedded PIN Policy allows at least a combination of Numeric value ('30' to '39') or alphabetic upper case ('A' to 'Z') or alphabetic lower case ('a' to 'z'), so the possible combination of value for the Global PIN is greater than  $10^6$ . Then the strength of this authentication method is as follow:

- The probability that a random attempt at authentication will succeed is lower than  $1/10^6$
- Based on a maximum count of 15 for consecutive failed service authentication attempts, the probability that a random attempt will succeed over a one minute period is lower than  $15/10^6$

### 5.4 Platform Services

All services implemented by the Module are listed in the tables below. Each service description also describes all usage of CSPs by the service.

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

| Service                   | Description  |
|---------------------------|--|
| Card Reset (Self-test)    | Power cycle the Module by removing and reinserting it into the contact reader slot, or by reader assertion of the RST signal. The <i>Card Reset</i> service will invoke the power on self-tests described in Section <a href="#">§10-Self-test</a> .<br>Moreover, on any card reset, the Module overwrites with zeros the RAM copy of, OS-RNG-STATE, SD-SENC, SD-SMAC and SD-SDEK.<br>The Module can also write the values of all CSPs stored in EEPROM as a consequence of restoring values in the event of card tearing or a similar event.<br>During the self-tests, the module generates the RAM copy of OS-RNG-STATE and updates the EEPROM copy of OS-RNG-STATE. |
| EXTERNAL AUTHENTICATE (*) | Authenticates the operator and establishes a secure channel. Must be preceded by a successful INITIALIZE UPDATE. Uses SD-SENC and SD-SMAC.   |
| INITIALIZE UPDATE (*)     | Initializes the Secure Channel; to be followed by EXTERNAL AUTHENTICATE. Uses the SD-KENC, SD-KMAC and SD-KDEK master keys to generate the SD-SENC, SD-SMAC and SD-SDEK session keys, respectively.  |
| GET DATA                  | Retrieve a single data object. Optionally uses SD-SENC, SD-SMAC (SCP).   |
| MANAGE CHANNEL            | Open and close supplementary logical channels. Optionally uses SD-SENC, SD-SMAC (SCP).   |
| SELECT                    | Select an applet. Does not use CSPs.   |

**Table 18 - Unauthenticated Services and CSP Usage**

| Service    | Description  | CO |
|------------|--|----|
| DELETE     | Delete an applet from EEPROM.<br>This service is provided for the situation where an applet exists on the card, and does not impact platform CSPs. Optionally uses SD-SENC, SD-SMAC (SCP). | X  |
| GET STATUS | Retrieve information about the card. Does not use CSPs. Optionally uses SD-SENC, SD-SMAC (SCP).  | X  |

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

| Service          | Description  | CO |
|------------------|--|----|
| INSTALL          | Perform Card Content management. Optionally uses SD-SENC, SD-SMAC (SCP). Optionally, the Module uses the DAP-SYM key to verify the package signature.                | X  |
| LOAD             | Load a load file (e.g. an applet). Optionally uses SD-SENC, SD-SMAC (SCP).   | X  |
| PUT DATA         | Transfer data to an application during command processing. Optionally uses SD-SENC, SD-SMAC (SCP).   | X  |
| PUT KEY (*)      | Load Card Manager keys<br>The Module uses the SD-KDEK key to decrypt the keys to be loaded. Optionally uses SD-SENC, SD-SMAC (SCP).                                  | X  |
| SET STATUS       | Modify the card or applet life cycle status. Optionally uses SD-SENC, SD-SMAC (SCP).   | X  |
| STORE DATA       | Transfer data to an application or the security domain (ISD) processing the command.<br>Optionally, updates OS-GLOBALPIN.<br>Optionally uses SD-SENC, SD-SMAC (SCP). | X  |
| GET MEMORY SPACE | Monitor the memory space available on the card. Optionally uses SD-SENC, SD-SMAC (SCP).  | X  |
| SET ATR          | Change the card ATR. Optionally uses SD-SENC, SD-SMAC (SCP).   | X  |

**Table 19 – Authenticated Card Manager Services and CSP Usage**

All of the above commands use the SD-SENC and SD-SMAC keys for secure channel communications, and SD-SMAC for firmware load integrity.

The card life cycle state determines which modes are available for the secure channel. In the SECURED card life cycle state, all command data must be secured by at least a MAC. As specified in the GP specification, there exist earlier states (before card issuance) in which a MAC might not be necessary to send Issuer Security Domain commands. Note that the LOAD service enforces MAC usage.

### 5.5 IDPRIME MD Services

All services implemented by the IDPrime MD applet are listed in the table below.

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

| Service                   | Description   | ICAA | IUSR | UA |
|---------------------------|---|------|------|----|
| EXTERNAL AUTHENTICATE (*) | Authenticates the external terminal to the card.<br>Sets the secure channel mode. | X    | X    | X  |
| INTERNAL AUTHENTICATE (*) | Authenticates the card to the terminal  | X    | X    | X  |
| SELECT                    | Selects a DF or an EF by its file ID, path or name (in the case of DFs).          | X    | X    | X  |

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

| Service                                  | Description  | ICAA | IUSR | UA |
|--|--|------|------|----|
| CHANGE REFERENCE DATA                    | Changes the value of a PIN.  | X    | X    |    |
| CREATE FILE                              | Creates an EF under the root or the currently selected DF or creates a DF under the root.  | X    | X    |    |
| DELETE FILE                              | Deletes the current DF or EF.  | X    | X    |    |
| DELETE ASYMMETRIC KEY PAIR               | Deletes an RSA or ECDSA Asymmetric Key Pair  | X    | X    |    |
| ERASE ASYMMETRIC KEY                     | Erases an RSA or ELC Asymmetric Key Pair   | X    | X    |    |
| GET DATA<br>(IDPrime MD Applet Specific) | Retrieves the following information: <ul style="list-style-type: none"> <li>■ CPLC data</li> <li>■ Applet version</li> <li>■ Software version (includes applet version - BER-TLV format)</li> <li>■ Available EEPROM memory</li> <li>■ Additional applet parameters</li> <li>■ PIN Policy Error</li> </ul> | X    | X    | X  |
| GET DATA OBJECT                          | Retrieves the following information: <ul style="list-style-type: none"> <li>■ Public key elements</li> <li>■ KICC</li> <li>■ The contents of a specified SE</li> <li>■ Information about a specified PIN</li> </ul>  | X    | X    | X  |
| PUT DATA<br>(IDPrime MD Applet Specific) | Creates or updates a data object <ul style="list-style-type: none"> <li>■ Create container<sup>1</sup></li> <li>■ Update public/private keys(1)</li> </ul>   |      | X    |    |
| PUT DATA<br>(IDPrime MD Applet Specific) | Creates or updates a data object <ul style="list-style-type: none"> <li>■ Access Conditions</li> <li>■ Applet Parameters (Admin Key, Card Read Only and Admin Key Try Limit )</li> <li>■ PIN Info</li> </ul>   | X    |      |    |

<sup>1</sup> Secure Messaging in Confidentiality is mandatory

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

| Service                                  | Description   | ICAA | IUSR | UA |
|--|---|------|------|----|
| PUT DATA<br>(IDPrime MD Applet Specific) | Creates or updates a data object<br>■ Update DES or AES Secret keys(1)  | X    | X    |    |
| READ BINARY                              | Reads part of a binary file.  | X    | X    | X  |
| ERASE BINARY                             | Erases part of a binary file.   | X    | X    |    |
| UPDATE BINARY                            | Updates part of a binary file.  | X    | X    |    |
| DEACTIVATE FILE                          | Changes the state of a file to OPERATIONAL (DEACTIVATED).   | X    | X    |    |
| ACTIVATE FILE                            | Changes the state of a file to OPERATIONAL (ACTIVATED).   | X    | X    |    |
| GENERATE AUTHENTICATE                    | Used to generate secure messaging session keys between both entities (IFD and ICC) as part of elliptic curve asymmetric key mutual authentication.  | X    | X    | X  |
| GENERATE KEY PAIR (*)                    | Generates an RSA or ECDSA key pair and stores both keys in the card. It returns the public part as its response.  |      | X    |    |
| PSO – VERIFY CERTIFICATE                 | Sends the IFD certificate C_CV.IFD.AUT used in asymmetric key mutual authentication to the card for verification. No real reason to use it in the personalization phase, but it is allowed. |      | X    |    |
| PSO - HASH                               | Entirely or partially hashes data prior to a PSO–Compute Digital Signature command or prepares the data if hashed externally  |      | X    |    |
| PSO – DECIPHER (*)                       | (RSA) Deciphers an encrypted message using a decipher key stored in the card.<br>(ECDSA) Generates a shared symmetric key.  |      | X    |    |
| PSO – COMPUTE DIGITAL SIGNATURE (*)      | Computes a digital signature.   |      | X    |    |
| CHECK RESET AND APPLET SELECTION         | Tells the terminal if the card has been reset or the applet has been reselected since the previous time that the command was performed.   | X    | X    | X  |
| GET CHALLENGE (*)                        | Generates an 8 or 16-byte random number.  |      |      | X  |

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

| Service                     | Description  | ICAA | IUSR | UA |
|-----------------------------|--|------|------|----|
| MANAGE SECURITY ENVIRONMENT | Supports two functions, Restore and Set. <ul style="list-style-type: none"> <li>■ Restore: replaces the current SE by an SE stored in the card.</li> <li>■ Set: sets or replaces one component of the current SE.</li> </ul> |      |      | X  |

**Table 20 – IDPrime MD applet Services and CSP Usage**

All services implemented by the MSPNP applet are listed in the table below.

| Service                          | Description   | ICAA | IUSR | UA |
|----------------------------------|---|------|------|----|
| GET DATA (MSPNP applet specific) | Retrieves the following information: <ul style="list-style-type: none"> <li>■ GUID</li> </ul> |      |      | X  |

**Table 21 – MSPNP applet Services**

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

### 6 Finite State Model

The CM is designed using a finite state machine model that explicitly specifies every operational and error state.

The CM includes Power on/off states, Cryptographic Officer states, User services states, applet loading states, Key/PIN loading states, Self-test states, Error states, and the GP life cycle states.

An additional document (Finite State Machine document) identifies and describes all the states of the module including all corresponding state transitions.

### 7 Physical security policy

The CM is a single-chip implementation that meets commercial-grade specifications for power, temperature, reliability, and shock/vibrations. The CM uses standard passivation techniques and is protected by passive shielding (metal layer coverings opaque to the circuitry below) and active shielding (a grid of top metal layer wires with tamper response). A tamper event detected by the active shield places the Module permanently into the Card Is Killed error state.

The CM is mounted in a plastic smartcard; physical inspection of the Module boundaries is not practical after mounting. Physical inspection of modules for tamper evidence is performed using a lot sampling technique during the card assembly process. The Module also provides a key to protect the Module from tamper during transport and the additional physical protections listed in Section 12 below.

### 8 Operational Environment

This section does not apply to CM. No code modifying the behavior of the CM operating system can be added after its manufacturing process.

Only authorized applets can be loaded at post-issuance under control of the Cryptographic Officer. Their execution is controlled by the CM operating system following its security policy rules.

### 9 Electromagnetic interference and compatibility (EMI/EMC)

The Module conforms to the EMI/EMC requirements specified by part 47 Code of Federal Regulations, Part 15, Subpart B, Unintentional Radiators, Digital Devices, Class B.

# IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

## 10 Self-test

Note (\*): Services/CSPs using disallowed functions are not allowed in the Approved mode.

### 10.1 Power-on self-test

Each time the CM is powered up it tests that the cryptographic algorithms still operate correctly and that sensitive data have not been damaged. Power-on self-tests are available on demand by power cycling the CM.

On power-on or reset, the CM performs the self-tests described in table below. All KATs must be completed successfully prior to any other use of cryptography by the CM. If one of the KATs fails, the CM enters the Card Is Mute error state.

| Test Target        | Description   |
|--------------------|---|
| Firmware Integrity | 16 bit CRC performed over all code located in Flash memory (for OS, Applets and filters).   |
| RNG                | Performs ANSI X9.31 KAT with fixed inputs (*)   |
| Triple-DES         | Performs separate encrypt and decrypt KATs using 2-Key Triple-DES (*) in ECB mode.  |
| AES                | Performs decrypt KAT using an AES 128 key in ECB mode. AES encrypt is self-tested as an embedded algorithm of AES-CMAC.   |
| AES-CMAC           | Performs an AES-CMAC Generate KAT using an AES 128 key. Note that AES-CMAC Verify is identical to a Generate KAT (perform Generate then compare to the input) hence a single KAT verifies both functions. |
| RSA                | Performs separate RSA PKCS#1 signature and verification KATs using an RSA 2048 bit key, and a RSA PKCS#1 signature KAT using the RSA CRT implementation with a 2048 bit key.                              |
| ECDSA              | Performs a ECDSA signature and verification KATs using an ECC P-224 key.  |
| ECC CDH            | Performs an ECC CDH KAT using an ECC P-224 key.   |
| SHA-1              | Performs a SHA-1 KAT.   |
| SHA-256            | Performs a SHA-256 KAT.   |
| SHA-512            | Performs a SHA-512 KAT.   |

**Table 22 – Power-On Self-Test**

### 10.2 Conditional self-tests

On every call to the [ANS X9.31] RNG (\*), the CM performs a stuck fault test to assure that the output is different than the previous value.

When any asymmetric key pair is generated (for RSA (\*) or ECC keys) the CM performs a pair-wise consistency test.

When new firmware is loaded into the CM using the LOAD command, the CM verifies the integrity of the new firmware (applet) using the SD-SMAC key for MAC process. Optionally, the CM may also verify a signature of the new firmware (applet) using the DAP-RSA public key (\*), the DAP-DES key (\*) or the DAP-AES key; the signature block in this scenario is signed by an external entity using the private key corresponding to DAP-RSA (\*) or the symmetric DAP-DES key (\*) or the DAP-AES key.

## IDPrime MD 830 - FIPS 140-2 Cryptographic Module Security Policy Level 3

### 11 Design Assurance

The CM meets the Level 3 Design Assurance section requirements.

#### 11.1 Configuration Management

An additional document (Configuration Management Plan document) defines the methods, mechanisms and tools that allow to identify and place under control all the data and information concerning the specification, design, implementation, generation, test and validation of the card software throughout the development and validation cycle.

#### 11.2 Delivery and Operation

Some additional documents ('Delivery and Operation', 'Reference Manual', 'Card Initialization Specification' documents) define and describe the steps necessary to deliver and operate the CM securely.

#### 11.3 Guidance Documents

The Guidance document provided with CM is intended to be the 'Reference Manual'. This document includes guidance for secure operation of the CM by its users as defined in the section: Roles, authentication and services.

#### 11.4 Language level

The CM operational environment is implemented using a high level language. A limited number of software modules have been written in assembler to optimize speed or size.

The IDPrime MD Applet is a Java applet designed for the Java Card environment.

### 12 Mitigation of other attacks policy

The Module implements defenses against:

- Fault attacks
- Side channel analysis (Timing Analysis, SPA/DPA, Simple/Differential Electromagnetic Analysis)
- Probing attacks
- Card tearing

### 13 Security Rules and Guidance

The Module implementation also enforces the following security rules:

- No additional interface or service is implemented by the Module which would provide access to CSPs.
- Data output is inhibited during key generation, self-tests, zeroization, and error states.
- There are no restrictions on which keys or CSPs are zeroized by the zeroization service.
- The Module does not support manual key entry, output plaintext CSPs or output intermediate key values.
- Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the Module.
- In accordance to NIST guidance, operators are responsible for insuring that a single Triple-DES key shall not be used to encrypt more than  $2^{16}$  64-bit data blocks.

**END OF DOCUMENT**
