

The attached DRAFT document (provided here for historical purposes) has been superseded by the following publication:

Publication Number: **NIST Special Publication (SP) 800-78-4 (2nd Draft)**

Title: **Cryptographic Algorithms and Key Sizes for Personal Identity Verification**

Publication Date: **May 2014**

- Final Publication: <https://doi.org/10.6028/NIST.SP.800-78-4> (which links to <http://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-78-4.pdf>).
- Information on other NIST Computer Security Division publications and programs can be found at: <http://csrc.nist.gov/>

The following information was posted with the attached DRAFT document:

May 13, 2013

SP 800-78-4

DRAFT Cryptographic Algorithms and Key Sizes for Personal Identity Verification

NIST announces the release of public comment for ***Draft Special Publication SP 800-78-4, Cryptographic Algorithms and Key Sizes for Personal Identity Verification (PIV)***. The document has been modified 1) to align with the Candidate Final FIPS 201-2 and Draft SP 800-73-4 and 2) to add requirements for Cryptographic Algorithm Validation Program (CAVP) validation testing. In particular, the following changes are introduced in Draft SP 800-78-4:

- Algorithm and key size requirements for the optional PIV Secure Messaging key have been added.
- RSA public keys may only have a public exponent of 65,537. (Client applications are still encouraged to be able to process RSA public keys that have any public exponent that is an odd positive integer greater than or equal to 65,537 and less than 2^{256} .)
- A new Section was added to provide requirements for CAVP validation testing.

Except for minor editorial changes, all changes can be reviewed with the track-change version of Draft SP 800-78-4 (see 2nd link below to view file with track changes).

NIST requests comments on Draft SP 800-78-4 by 5:00pm EDT on **June 14, 2013**. Please submit your comments, using the comment template form (see 3rd link below) to piv_comments @ nist.gov with "Comments on Public Draft SP 800-78-4" in the subject line.

Authority

74 This publication has been developed by NIST to further its statutory responsibilities under the Federal
75 Information Security Management Act (FISMA), Public Law (P.L.) 107-347. NIST is responsible for
76 developing information security standards and guidelines, including minimum requirements for Federal
77 information systems, but such standards and guidelines shall not apply to national security systems
78 without the express approval of appropriate Federal officials exercising policy authority over such
79 systems. This guideline is consistent with the requirements of the Office of Management and Budget
80 (OMB) Circular A-130, Section 8b(3), *Securing Agency Information Systems*, as analyzed in Circular A-
81 130, Appendix IV: *Analysis of Key Sections*. Supplemental information is provided in Circular A-130,
82 Appendix III, *Security of Federal Automated Information Resources*.

83 Nothing in this publication should be taken to contradict the standards and guidelines made mandatory
84 and binding on Federal agencies by the Secretary of Commerce under statutory authority. Nor should
85 these guidelines be interpreted as altering or superseding the existing authorities of the Secretary of
86 Commerce, Director of the OMB, or any other Federal official. This publication may be used by
87 nongovernmental organizations on a voluntary basis and is not subject to copyright in the United States.
88 Attribution would, however, be appreciated by NIST.

94 Certain commercial entities, equipment, or materials may be identified in this document in order to
95 describe an experimental procedure or concept adequately. Such identification is not intended to imply
96 recommendation or endorsement by NIST, nor is it intended to imply that the entities, materials, or
97 equipment are necessarily the best available for the purpose.

98 There may be references in this publication to other publications currently under development by NIST
99 in accordance with its assigned statutory responsibilities. The information in this publication, including
100 concepts and methodologies, may be used by Federal agencies even before the completion of such
101 companion publications. Thus, until each publication is completed, current requirements, guidelines,
102 and procedures, where they exist, remain operative. For planning and transition purposes, Federal
agencies may wish to closely follow the development of these new publications by NIST.

103 Organizations are encouraged to review all draft publications during public comment periods and
provide feedback to NIST. All NIST Computer Security Division publications, other than the ones
noted above, are available at <http://csrc.nist.gov/publications>.

Reports on Computer Systems Technology

114 The Information Technology Laboratory (ITL) at the National Institute of Standards and Technology
115 (NIST) promotes the U.S. economy and public welfare by providing technical leadership for the Nation's
116 measurement and standards infrastructure. ITL develops tests, test methods, reference data, proof of
117 concept implementations, and technical analyses to advance the development and productive use of
118 information technology. ITL's responsibilities include the development of management, administrative,
119 technical, and physical standards and guidelines for the cost-effective security and privacy of other than
120 national security-related information in Federal information systems. The Special Publication 800-series
121 reports on ITL's research, guidelines, and outreach efforts in information system security, and its
122 collaborative activities with industry, government, and academic organizations.

123
124
125

Abstract

126 Federal Information Processing Standard 201 (FIPS 201) defines requirements for the PIV lifecycle
127 activities including identity proofing, registration, PIV Card issuance, and PIV Card usage. FIPS 201 also
128 defines the structure of an identity credential that includes cryptographic keys. This document contains
129 the technical specifications needed for the mandatory and optional cryptographic keys specified in FIPS
130 201 as well as the supporting infrastructure specified in FIPS 201 and the related Special Publication 800-
131 73, *Interfaces for Personal Identity Verification* [SP800-73], and SP 800-76, *Biometric Data Specification*
132 *for Personal Identity Verification* [SP800-76], that rely on cryptographic functions.

181		

182 **1 Introduction**

183 Homeland Security Presidential Directive-12 (HSPD 12) mandated the creation of new standards
184 for interoperable identity credentials for physical and logical access to Federal government
185 locations and systems. Federal Information Processing Standard 201 (FIPS 201), *Personal*
186 *Identity Verification (PIV) of Federal Employees and Contractors*, was developed to establish
187 standards for identity credentials [FIPS201]. This document, Special Publication 800-78-4,
188 specifies the cryptographic algorithms and key sizes for PIV systems and is a companion
189 document to FIPS 201.

190 **1.1 Purpose**

191 FIPS 201 defines requirements for the PIV lifecycle activities including identity proofing,
192 registration, PIV Card issuance, and PIV Card usage. FIPS 201 also defines the structure of an
193 identity credential that includes cryptographic keys. This document contains the technical
194 specifications needed for the mandatory and optional cryptographic keys specified in FIPS 201
195 as well as the supporting infrastructure specified in FIPS 201 and the related Special Publication
196 800-73, *Interfaces for Personal Identity Verification* [SP800-73], and SP 800-76, *Biometric Data*
197 *Specification for Personal Identity Verification* [SP800-76], that rely on cryptographic functions.

198 **1.2 Scope**

199 The scope of this recommendation encompasses the PIV Card, infrastructure components that
200 support issuance and management of the PIV Card, and applications that rely on the credentials
201 supported by the PIV Card to provide security services. The recommendation identifies
202 acceptable symmetric and asymmetric encryption algorithms, digital signature algorithms, key
203 establishment schemes, and message digest algorithms, and specifies mechanisms to identify the
204 algorithms associated with PIV keys or digital signatures.

205 Algorithms and key sizes have been selected for consistency with applicable Federal standards
206 and to ensure adequate cryptographic strength for PIV applications. All cryptographic
207 algorithms employed in this specification provide at least 80 bits of security strength. For
208 detailed guidance on the strength of cryptographic algorithms, see [SP800-57(1)],
209 *Recommendation on Key Management – Part 1: General*.

210 **1.3 Audience and Assumptions**

211 This document is targeted at Federal agencies and implementers of PIV systems. Readers are
212 assumed to have a working knowledge of cryptography and public key infrastructure (PKI)
213 technology.

214 **1.4 Document Overview**

215 The document is organized as follows:

- 216 + Section 1, *Introduction*, provides the purpose, scope, audience, and assumptions of the
217 document and outlines its structure.

- 218 + Section 2, *Application of Cryptography in FIPS 201*, identifies the cryptographic
219 mechanisms and objects that employ cryptography as specified in FIPS 201 and its
220 supporting documents.
- 221 + Section 3, *On Card Cryptographic Requirements*, describes the cryptographic
222 requirements for cryptographic keys and authentication information stored on the PIV
223 Card.
- 224 + Section 4, *Certificate Status Information*, describes the cryptographic requirements for
225 status information generated by PKI certification authorities (CA) and Online Certificate
226 Status Protocol (OCSP) responders.
- 227 + Section 5, *PIV Card Application Administration Keys*, describes the cryptographic
228 requirements for management of information stored on the PIV Card.
- 229 + Section 6, *Identifiers for PIV Card Interfaces*, specifies key reference values and
230 algorithm identifiers for the application programming interface and card commands
231 defined in [SP 800-73].
- 232 + Section 7, *Cryptographic Algorithm Validation Testing Requirements*, specifies the
233 cryptographic algorithm validation testing that must be performed on the PIV Card based
234 on the keys and algorithms that it supports.
- 235 + Appendix A, *Acronyms*, contains the list of acronyms used in this document.
- 236 + Appendix B, *References*, contains the list of documents used as references by this
237 document.

2 Application of Cryptography in FIPS 201

239 FIPS 201 employs cryptographic mechanisms to authenticate cardholders, secure information
240 stored on the PIV Card, and secure the supporting infrastructure.

241 FIPS 201 and its supporting documents specify a suite of keys to be stored on the PIV Card for
242 personal identity verification, digital signature generation, and key management. The PIV
243 cryptographic keys specified in FIPS 201 are:

- 244 + the asymmetric PIV Authentication key;
- 245 + an asymmetric Card Authentication key;
- 246 + a symmetric Card Authentication key;
- 247 + an asymmetric digital signature key for signing documents and messages;
- 248 + an asymmetric key management key, supporting key establishment or key transport, and
249 up to twenty retired key management keys;
- 250 + a symmetric PIV Card Application Administration Key; and
- 251 + an asymmetric PIV Secure Messaging key, supporting the establishment of session keys
252 for use with secure messaging.

253 The cryptographic algorithms, key sizes, and parameters that may be used for these keys are
254 specified in Section 3.1. PIV Cards must implement private key computations for one or more of
255 the algorithms identified in this section.

256 Cryptographically protected objects specified in FIPS 201, SP 800-73, and SP 800-76 include:

- 257 + the X.509 certificates for each asymmetric key on the PIV Card, except the PIV Secure
258 Messaging key;
- 259 + a card verifiable certificate (CVC) for the PIV Secure Messaging key;
- 260 + a digitally signed *Card Holder Unique Identifier* (CHUID);
- 261 + digitally signed biometrics using the Common Biometric Exchange Formats Framework
262 (CBEFF) signature block; and
- 263 + the SP 800-73 *Security Object*, which is a digitally signed hash table.

264 The cryptographic algorithms, key sizes, and parameters that may be used to protect these
265 objects are specified in Section 3.2. Certification authorities (CA) and card management systems
266 that protect these objects must support one or more of the cryptographic algorithms, key sizes,
267 and parameters specified in Section 3.2.

268 Applications may be designed to use any or all of the cryptographic keys and objects stored on
269 the PIV Card. Where maximum interoperability is required, applications should support all of
270 the identified algorithms, key sizes, and parameters specified in Sections 3.1 and 3.2.

271 FIPS 201 requires CAs and Online Certificate Status Protocol (OCSP) responders to generate
272 and distribute digitally signed certificate revocation lists (CRL) and OCSP status messages.
273 These revocation mechanisms support validation of the PIV Card, the PIV cardholder, the
274 cardholder's digital signature key, and the cardholder's key management key.

275 The signed revocation mechanisms specified in FIPS 201 are:

- 276 + X.509 CRLs that specify the status of a group of X.509 certificates; and
- 277 + OCSP status response messages that specify the status of a particular X.509 certificate.

278 The cryptographic algorithms, key sizes, and parameters that may be used to sign these
279 mechanisms are specified in Section 4. Section 4 also describes rules for encoding the signatures
280 to ensure interoperability.

281 FIPS 201 permits optional card management operations. These operations may only be
282 performed after the PIV Card authenticates the card management system. Card management
283 systems are authenticated through the use of PIV Card Application Administration Keys. The
284 cryptographic algorithms and key sizes that may be used for these keys are specified in Section
285 5.

286 **3 On Card Cryptographic Requirements**

287 FIPS 201 identifies a suite of objects that are stored on the PIV Card for use in authentication
 288 mechanisms or in other security protocols. These objects may be divided into three classes:
 289 cryptographic keys, signed authentication information stored on the PIV Card, and message
 290 digests of information stored on the PIV Card. Cryptographic requirements for PIV keys are
 291 detailed in Section 3.1. Cryptographic requirements for other stored objects are detailed in
 292 Section 3.2.

293 **3.1 PIV Cryptographic Keys**

294 FIPS 201 specifies six different classes of cryptographic keys to be used as credentials by the
 295 PIV cardholder:

- 296 + the mandatory PIV Authentication key;
- 297 + the mandatory asymmetric Card Authentication key;
- 298 + an optional symmetric Card Authentication key;
- 299 + a conditionally mandatory digital signature key;
- 300 + a conditionally mandatory key management key;¹ and
- 301 + an optional asymmetric key to establish session keys for secure messaging.

302 Table 3-1 establishes specific requirements for cryptographic algorithms and key sizes for each
 303 key type. Table 3-1 also specifies time periods with different sets of acceptable algorithms for
 304 each key type. Note that use of 1024-bit RSA for digital signature and key management keys
 305 was phased out in 2008. The use of 1024-bit RSA for authentication keys is permitted to
 306 leverage current products and promote efficient adoption of FIPS 201, but must be phased out by
 307 12/31/2013. These requirements anticipate that digital signature and key management keys will
 308 be used to protect data for longer periods of time, while data enciphered solely for authentication
 309 is usually a random challenge (rather than sensitive information) and is generally not retained.

310 In addition to the key sizes, keys must be generated using secure parameters. Rivest, Shamir,
 311 Adleman (RSA) keys must be generated using a public exponent of 65,537. Elliptic curve keys
 312 must correspond to one of the following recommended curves from [FIPS186]:

- 313 + Curve P-256; or
- 314 + Curve P-384.

315 To promote interoperability, this specification further limits PIV Authentication and Card
 316 Authentication elliptic curve keys to a single curve (P-256). PIV cryptographic keys for digital
 317 signatures and key management may use P-256 or P-384, based on application requirements.
 318 There is no phase out date specified for either curve.

¹ The digital signature and key management keys are mandatory if the cardholder has a government-issued email account at the time of credential issuance.

319 If the PIV Card Application supports the virtual contact interface [SP800-73] and the digital
 320 signature key, the key management key, or any of the retired key management keys are elliptic
 321 curve keys corresponding to Curve P-384, then the PIV Secure Messaging key shall use P-384,
 322 otherwise it may use P-256 or P-384.

323 **Table 3-1. Algorithm and Key Size Requirements for PIV Key Types**

PIV Key Type	Time Period for Use	Algorithms and Key Sizes
PIV Authentication key	Through 12/31/2013	RSA (1024 or 2048 bits) ECDSA (Curve P-256)
	After 12/31/2013	RSA (2048 bits) ECDSA (Curve P-256)
asymmetric Card Authentication key	Through 12/31/2013	RSA (1024 or 2048 bits) ECDSA (Curve P-256)
	After 12/31/2013	RSA (2048 bits) ECDSA (Curve P-256)
symmetric Card Authentication key	After 12/31/2010	3TDEA ² AES-128, AES-192, or AES-256
digital signature key	After 12/31/2008	RSA (2048 bits) ECDSA (Curve P-256 or P-384)
key management key	After 12/31/2008	RSA key transport (2048 bits); ECDH (Curve P-256 or P-384)
PIV Secure Messaging key		ECDH (Curve P-256 or P-384)

324 While this specification requires that the RSA public exponent associated with PIV keys be
 325 65,537, applications should be able to process RSA public keys that have any public exponent
 326 that is an odd positive integer greater than or equal to 65,537 and less than 2^{256} .

327 This specification requires that the key management key must be an RSA key transport key or an
 328 Elliptic Curve Diffie-Hellman (ECDH) key. The specifications for RSA key transport are
 329 [PKCS1] and [SP800-56B]; the specification for ECDH is [SP800-56A].

330 **3.2 Authentication Information Stored on the PIV Card**

331 **3.2.1 Specification of Digital Signatures on Authentication Information**

332 FIPS 201 requires the use of digital signatures to protect the integrity and authenticity of
 333 information stored on the PIV Card. FIPS 201 and SP 800-73 require digital signatures on the
 334 following objects stored on the PIV Card:

- 335 + X.509 public key certificates;
- 336 + the optional card verifiable certificate (CVC);
- 337 + the CHUID;

² 3TDEA is Triple DES using Keying Option 1 from [SP800-67], which requires that all three keys be unique (i.e., $Key_1 \neq Key_2$, $Key_2 \neq Key_3$, and $Key_3 \neq Key_1$).

- 338 + biometric information (e.g., fingerprints); and
 339 + the SP 800-73 Security Object.

340 Approved digital signature algorithms are specified in [FIPS 186]. Table 3-2 provides specific
 341 requirements for public key algorithms and key sizes, hash algorithms, and padding schemes for
 342 generating digital signatures for digitally signed information stored on the PIV Card. Agencies
 343 are cautioned that generating digital signatures with elliptic curve algorithms may initially limit
 344 interoperability.

345 **Table 3-2. Signature Algorithm and Key Size Requirements for PIV Information**

Public Key Algorithms and Key Sizes	Hash Algorithms	Padding Scheme
RSA (2048 or 3072)	SHA-256	PKCS #1 v1.5
	SHA-256	PSS
ECDSA (Curve P-256)	SHA-256	N/A
ECDSA (Curve P-384)	SHA-384	N/A

346 Note: As of January 1, 2011, only SHA-256 may be used to generate RSA signatures on PIV
 347 objects. RSA signatures may use either the PKCS #1 v1.5 padding scheme or the Probabilistic
 348 Signature Scheme (PSS) padding as defined in [PKCS1]. The PSS padding scheme OID is
 349 independent of the hash algorithm; the hash algorithm is specified as a parameter (for details, see
 350 [PKCS1]).

351 The CVC shall be signed using ECDSA (Curve P-256) with SHA-256 if it contains an ECDH
 352 (Curve P-256) subject public key, and shall be signed using ECDSA (Curve P-384) with SHA-
 353 384 otherwise.

354 FIPS 201, SP 800-73, and SP 800-76 specify formats for the CHUID, the Security Object, the
 355 biometric information, and X.509 public key certificates, which rely on object identifiers (OID)
 356 to specify which signature algorithm was used to generate the digital signature. The object
 357 identifiers specified in Table 3-3, below, must be used in FIPS 201 implementations to identify
 358 the signature algorithm.³

359 **Table 3-3. FIPS 201 Signature Algorithm Object Identifiers**

Signature Algorithm	Object Identifier
RSA with SHA-1 and PKCS #1 v1.5 padding	sha1WithRSAEncryption ::= {iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs-1(1) 5}
RSA with SHA-256 and PKCS #1 v1.5 padding	sha256WithRSAEncryption ::= {iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs-1(1) 11}
RSA with SHA-256 and PSS padding	id-RSASSA-PSS ::= {iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs-1(1) 10}
ECDSA with SHA-256	ecdsa-with-SHA256 ::= {iso(1) member-body(2) us(840) ansi-X9-62(10045) signatures(4) ecdsa-with-SHA2 (3) 2}

³ The OID for RSA with SHA-1 and PKCS #1 v1.5 padding is included in Table 3-3 since applications may encounter X.509 certificates and other data objects that were signed before January 1, 2011, using this algorithm. RSA with SHA-1 and PKCS #1 v1.5 may also be used through December 31, 2013, in some circumstances, as described in Section 4, to sign CRLs.

Signature Algorithm	Object Identifier
ECDSA with SHA-384	ecdsa-with-SHA384 ::= {iso(1) member-body(2) us(840) ansi-X9-62(10045) signatures(4) ecdsa-with-SHA2 (3) 3}

3.2.2 Specification of Public Keys In X.509 Certificates

FIPS 201 requires generation and storage of an X.509 certificate to correspond with each asymmetric private key contained on the PIV Card, except the PIV Secure Messaging key. X.509 certificates include object identifiers to specify the cryptographic algorithm associated with a public key. Table 3-4, below, specifies the object identifiers that may be used in certificates to indicate the algorithm for a subject public key.

Table 3-4. Public Key Object Identifiers for PIV Key Types

PIV Key Type	Asymmetric Algorithm	Object Identifier
PIV Authentication key; Card Authentication key; digital signature key	RSA	{iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs-1(1) 1}
	ECDSA	{iso(1) member-body(2) us(840) ansi-X9-62(10045) id-publicKeyType(2) 1}
key management key	RSA	{iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs-1(1) 1}
	ECDH	{iso(1) member-body(2) us(840) ansi-X9-62(10045) id-publicKeyType(2) 1}

A single object identifier is specified in Table 3-4 for all elliptic curve keys. An additional object identifier must be supplied in a parameters field to indicate the elliptic curve associated with the key. Table 3-5, below, identifies the named curves and associated OIDs. (RSA exponents are encoded with the modulus in the certificate's subject public key, so the OID is not affected.)

Table 3-5. ECC Parameter Object Identifiers for Approved Curves

Asymmetric Algorithm	Object Identifier
Curve P-256	ansip256r1 ::= { iso(1) member-body(2) us(840) ansi-X9-62(10045) curves(3) prime(1) 7 }
Curve P-384	ansip384r1 ::= { iso(1) identified-organization(3) certicom(132) curve(0) 34 }

3.2.3 Specification of Message Digests in the SP 800-73 Security Object

SP 800-73 mandates inclusion of a Security Object consistent with the Authenticity/Integrity Code defined by the International Civil Aviation Organization (ICAO) in [MRTD]. This object contains message digests of other digital information stored on the PIV Card and is digitally signed. This specification requires that the message digests of digital information be computed using the same hash algorithm used to generate the digital signature on the Security Object. The set of acceptable algorithms is specified in Table 3-2. The Security Object format identifies the

380 hash algorithm used when computing the message digests by inclusion of an object identifier; the
 381 appropriate object identifiers are identified in Table 3-6.⁴

382

Table 3-6. Hash Algorithm Object Identifiers

Hash Algorithm	Algorithm OID
SHA-1	id-sha1 ::= {iso(1) identified-organization(3) oiw(14) secsig(3) algorithms(2) 26}
SHA-256	id-sha256 ::= {joint-iso-itu-t(2) country(16) us(840) organization(1) gov(101) csor(3) nistalgorithm(4) hashalgs(2) 1}
SHA-384	id-sha384 ::= {joint-iso-itu-t(2) country(16) us(840) organization(1) gov(101) csor(3) nistalgorithm(4) hashalgs(2) 2}

⁴ The OID for SHA-1 is included in Table 3-6 since applications may encounter Security Objects that were signed before January 1, 2011, using RSA with SHA-1 and PKCS #1 v1.5 padding.

4 Certificate Status Information

384 The FIPS 201 functional component *PIV Card Issuance and Management Subsystem* generates
385 and distributes status information for PIV asymmetric keys, other than PIV Secure Messaging
386 keys. FIPS 201 mandates two formats for certificate status information:

- 387 + X.509 CRLs; *and*
- 388 + OCSP status response messages.

389 The CRLs and OCSP status responses shall be digitally signed to support authentication and
390 integrity using a key size and hash algorithm that satisfy the requirements for signing PIV
391 information, as specified in Table 3-2⁵, and that are at least as large as the key size and hash
392 algorithm used to sign the certificate.

393 CRLs and OCSP messages rely on object identifiers to specify which signature algorithm was
394 used to generate the digital signature. The object identifiers specified in Table 3-3 must be used
395 in CRLs and OCSP messages to identify the signature algorithm.

⁵ CRLs and OCSP status responses that only provide status information for certificates that were signed with RSA with SHA-1 and PKCS #1 v1.5 padding may be signed using RSA with SHA-1 and PKCS #1 v1.5 padding through 12/31/2013.

396 **5 PIV Card Application Administration Keys**

397 PIV Cards may support card activation by the card management system to support card
 398 personalization and post-issuance card update. PIV Cards that support card personalization and
 399 post-issuance updates perform a challenge response protocol using a symmetric cryptographic
 400 key (i.e., the PIV Card Application Administration Key) to authenticate the card management
 401 system. After successful authentication, the card management system can modify information
 402 stored in the PIV Card. Table 5-1, below, establishes specific requirements for cryptographic
 403 algorithms and key sizes for PIV Card Application Administration Keys.

404 **Table 5-1. Algorithm and Key Size Requirements for PIV Card Application Administration Keys**

Card Expiration Date	Algorithm
After 12/31/2010	3TDEA AES-128, AES-192, or AES-256

405

6 Identifiers for PIV Card Interfaces

SP 800-73 defines an application programming interface, the *PIV Client Application Programming Interface* (Part 3), and a set of mandatory card commands, the *PIV Card Application Card Command Interface* (Part 2). The command syntaxes for these interfaces identify PIV keys using one-byte key references; their associated algorithms (or suites of algorithms) are specified using one-byte algorithm identifiers. The same identifiers are used in both interfaces.

Section 6.1 specifies the key reference values for each of the PIV key types. Section 6.2 defines algorithm identifiers for each cryptographic algorithm supported by this specification. Section 6.3 identifies valid combinations of key reference values and algorithm identifiers based on the period of use.

6.1 Key Reference Values

A PIV Card key reference is a one-byte identifier that specifies a cryptographic key according to its PIV Key Type. Table 6-1 defines the key reference values used on the PIV interfaces for PIV Key Types.

Table 6-1. Key References for PIV Key Types

PIV Key Type	Key Reference Value
PIV Secure Messaging key	'03'
retired key management key	'82', '83', '84', '85', '86', '87', '88', '89', '8A', '8B', '8C', '8D', '8E', '8F', '90', '91', '92', '93', '94', '95'
PIV Authentication key	'9A'
PIV Card Application Administration Key	'9B'
digital signature key	'9C'
key management key	'9D'
Card Authentication key	'9E'

6.2 PIV Card Algorithm Identifiers

A PIV Card algorithm identifier is a one-byte identifier that specifies a cryptographic algorithm and key size, or a suite of algorithms and key sizes. For symmetric cryptographic operations, the algorithm identifier also specifies a mode of operation (i.e., ECB). Table 6-2 lists the algorithm identifiers for the cryptographic algorithms that may be recognized on the PIV interfaces. All other algorithm identifier values are reserved for future use.

428

Table 6-2. Identifiers for Supported Cryptographic Algorithms

Algorithm Identifier	Algorithm – Mode
'00'	3 Key Triple DES – ECB
'03'	3 Key Triple DES – ECB
'06'	RSA 1024 bit modulus, $65,537 \leq \text{exponent} \leq 2^{256} - 1$
'07'	RSA 2048 bit modulus, $65,537 \leq \text{exponent} \leq 2^{256} - 1$
'08'	AES-128 – ECB
'0A'	AES-192 – ECB
'0C'	AES-256 – ECB
'11'	ECC: Curve P-256
'14'	ECC: Curve P-384
'27'	Cipher Suite 2
'2B'	Cipher Suite 4

429 Note that both the '00' and '03' algorithm identifiers correspond to 3 Key Triple DES – ECB.

430 Algorithm identifiers '27' and '2B' represent suites of algorithms and key sizes for use with
 431 secure messaging and key establishment. Cipher Suite 2 (CS2) is the cipher suite used to
 432 establish session keys and for secure messaging when the PIV Secure Messaging key is an
 433 ECDH (Curve P-256) key, and Cipher Suite 4 (CS4) is the cipher suite used to establish session
 434 keys and for secure messaging when the PIV Secure Messaging key is an ECDH (Curve P-384)
 435 key. Details of secure messaging, the key establishment protocol, and the algorithms and key
 436 sizes for these two cipher suites are specified in SP 800-73, Part 2.

437 6.3 Algorithm Identifiers for PIV Key Types

438 Table 6-3 summarizes the set of algorithms supported for each key reference value based on the
 439 time period of use.

440

Table 6-3. PIV Card Keys: Key References and Algorithms

PIV Key Type	Key Reference Value	Time Period for Use	Permitted Algorithm Identifiers
PIV Secure Messaging key	'03'		'27', '2B'
retired key management key	'82', '83', '84', '85', '86', '87', '88', '89', '8A', '8B', '8C', '8D', '8E', '8F', '90', '91', '92', '93', '94', '95'		'06', '07', '11', '14'
PIV Authentication key	'9A'	Through 12/31/2013	'06', '07', '11'
		After 12/31/2013	'07', '11'
PIV Card Application Administration Key	'9B'	After 12/31/2010	'00', '03', '08', '0A', '0C'
digital signature key	'9C'	After 12/31/2008	'07', '11', '14'
key management key	'9D'	After 12/31/2008	'07', '11', '14'
asymmetric Card Authentication key	'9E'	Through 12/31/2013	'06', '07', '11'
		After 12/31/2013	'07', '11'
symmetric Card Authentication key	'9E'	After 12/31/2010	'00', '03', '08', '0A', '0C'

441

7 Cryptographic Algorithm Validation Testing Requirements

442 As noted in Section 4.2.2 of [FIPS201], the PIV Card shall be validated under [FIPS140] with an
 443 overall validation of Level 2 and with Level 3 physical security. The scope of the Cryptographic
 444 Module Validation Program (CMVP) validation shall include all cryptographic operations
 445 performed over both the contact and contactless interfaces. Table 7-1 describes the
 446 Cryptographic Algorithm Validation Program (CAVP) tests that are required, at the time of
 447 publication, for each supported key and algorithm. If any changes are made to the CAVP
 448 validation requirements, the changes, along with the deadlines for conformance with these
 449 requirements, will be posted on NIST’S “Personal Identity Verification Program (NPIVP)” web
 450 page at <http://csrc.nist.gov/groups/SNS/piv/npivp/index.html>.

451

Table 7-1. Cryptographic Algorithm Validation Program (CAVP) Validation Requirements

Supported Private Keys	Supported Algorithm	Required Functionality	Minimum CAVP Validation Requirements
PIV Authentication key	2048-bit RSA	<i>Key Generation and Signature Generation for 2048-bit RSA with public key exponent 65,537</i>	Key Generation: 186-2: Key(gen)(MOD: 2048 PubKey Values: 65537) Prerequisite: RNG or DRBG; SHS 186-3: 186-3KEY(gen): FIPS186-3_Fixed_e, FIPS186-3_Fixed_e_Value PGM(Prime Generation Methods with supporting variables) Prerequisites: RNG or DRBG; SHS Signature Generation: 186-3 RSASP1 component: (PKCS #1 v1.5 (SHA-256) and RSASSA-PSS)
	ECDSA (Curve P-256)	<i>Key Generation and Signature Generation for Curve P-256</i>	Key Generation: 186-2: PKG (Public Key Generation): CURVE(P-256) Prerequisites: DRBG or RNG 186-3: PKG (Public Key Generation): CURVE(P-256 (ExtraRandomBits and/or TestingCandidates)) Prerequisites: DRBG or RNG Signature Generation: 186-3 ECDSA Signature Generation component: CURVE(P-256 (SHA-256)) Prerequisites: DRBG or RNG

452

Supported Private Keys	Supported Algorithm	Required Functionality	Minimum CAVP Validation Requirements
asymmetric Card Authentication key	2048-bit RSA	<i>Signature Generation for 2048-bit RSA</i>	<p>Key Generation (if key can be generated on card):</p> <p>186-2: Key(gen)(MOD: 2048 PubKey Values: 65537) Prerequisite: RNG or DRBG; SHS</p> <p>186-3: 186-3KEY(gen): FIPS186-3_Fixed_e, FIPS186-3_Fixed_e_Value PGM(Prime Generation Methods with supporting variables) Prerequisites: RNG or DRBG; SHS</p> <p>Signature Generation: 186-3 RSASP1 component: (PKCS #1 v1.5 (SHA-256) and RSASSA-PSS)</p>
	ECDSA (Curve P-256)	<i>Signature Generation for Curve P-256</i>	<p>Key Generation (if key can be generated on card):</p> <p>186-2: PKG (Public Key Generation): CURVE(P-256) Prerequisites: DRBG or RNG</p> <p>186-3: PKG (Public Key Generation): CURVE(P-256 (ExtraRandomBits and/or TestingCandidates)) Prerequisites: DRBG or RNG</p> <p>Signature Generation: 186-3 ECDSA Signature Generation component: CURVE(P-256 (SHA-256)) Prerequisites: DRBG or RNG</p>
symmetric Card Authentication key	3TDEA	<i>Encryption and Decryption for 3TDEA</i>	TECB(e/d; KO 1)

457 **Appendix A—Acronyms**

458 The following abbreviations and acronyms are used in this standard:

459	3TDEA	Three key TDEA (TDEA with Keying Option 1 [SP800-67])
460	AES	Advanced Encryption Standard [FIPS197]
461	CA	Certification Authority
462	CAVP	Cryptographic Algorithm Validation Program
463	CBC	Cipher Block Chaining
464	CBEFF	Common Biometric Exchange Formats Framework
465	CDH	Cofactor Diffie-Hellman
466	CHUID	Card Holder Unique Identifier
467	CMAC	Cipher-Based Message Authentication Code
468	CMVP	Cryptographic Module Validation Program
469	CRL	Certificate Revocation List
470	CVC	Card Verifiable Certificate
471	DES	Data Encryption Standard
472	DRBG	Deterministic Random Bit Generator
473	ECB	Electronic Codebook
474	ECC	Elliptic Curve Cryptography
475	ECDH	Elliptic Curve Diffie-Hellman
476	ECDSA	Elliptic Curve Digital Signature Algorithm
477	FIPS	Federal Information Processing Standards
478	FISMA	Federal Information Security Management Act
479	ICAO	International Civil Aviation Organization
480	ITL	Information Technology Laboratory
481	NIST	National Institute of Standards and Technology
482	OCSP	Online Certificate Status Protocol
483	OID	Object Identifier
484	OMB	Office of Management and Budget
485	PIV	Personal Identity Verification
486	PKCS	Public-Key Cryptography Standards
487	PKI	Public Key Infrastructure
488	PSS	Probabilistic Signature Scheme
489	RNG	Random Number Generator
490	RSA	Rivest, Shamir, Adleman cryptographic algorithm
491	SHA	Secure Hash Algorithm

492	SHS	Secure Hash Standard
493	SP	Special Publication
494	TDEA	Triple Data Encryption Algorithm; Triple DEA
495	TECB	TDEA Electronic Codebook
